Introduction

Marinetti is a TCP/IP protocol suite for the Apple IIgs. It allows applications on an Apple IIgs with System 6.0.1 to connect to and interact with, an internet.

The Marinetti software is free of charge, and is available from various locations, including the Marinetti Home Page:

http://www.apple2.org/marinetti/

Updates to Marinetti and this document are products of the Marinetti Open Source Project.

http://sourceforge.net/projects/marinetti/

This document describes how to use Marinetti in your own programs, and the various tool calls which Marinetti accepts.

Using this document in conjunction with the Apple IIgs Toolbox Reference Manuals and widely available protocol RFCs, you should be able to add TCP/IP support to your Apple IIgs application.

Revisions since the last release of the Marinetti documentation are in blue, with a revision bar on the right hand side of the page, like this.

This documentation refers to and assumes a prior knowledge of the Apple IIgs toolbox. Apple IIgs toolbox reference manuals are available from:

Syndicomm Online Store
http://store.syndicomm.com

Marinetti uses a toolbox interface, you will need to issue the tool locator call _LoadOneTool(#54,#$200) before using it. The tool locator calls _StartUpTools and _ShutDownTools do not support the Marinetti tool set.

This document refers only to Marinetti 3.x, and not its predecessors, 2.0.1 or 1.0.

Marinetti is in no way connected to or with the vaporware product commonly referred to as “GS/TCP”, Derek Taubert’s Apple IIgs port of public domain TCP/IP source code which requires GNO/ME to run and as of the date of this document, has not been released.
New Features and bug fixes

Marinetti version 3.0 is an extension of Marinetti 2.0.1. All applications that were written for Marinetti 2.0.1 should also work under Marinetti 3.0.

New features and enhancements

Marinetti 3.0 includes the following new features and enhancements.

- Link layer module configuration data is now stored in the *:System:TCPIP:* folder with a name specified by the link layer module.
- New link layer version (2) to support new configuration data files.
- Event triggers, which allow programs to receive synchronous signalling from the TCP/IP stack for specific system and ipid events.
- DNR performance can now be tuned.
- PPP link layers now support the CHAP Authentication Protocol.
- PPP link layers now support the MS-CHAPv1 Authentication Protocol.
- MacIP link layer is now included.
- Uthernet link layer is now included.
- TCPSnooper tool is now included.
- Emulator link layer is now included.
- Uthernet II link layer is now included.
- TCP layer sets the MSS option according to the MTU reported by the link layer.
Bug fixes

Marinetti 3.0 includes fixes for the following bugs in Marinetti 2.0.1.

- There was a stack imbalance sending ICMP packets. Intermittent results.
- There was a stack imbalance when querying the status of UDP packets.
- There was a stack imbalance in incoming SYN error handler. TCPLogin would fail intermittently.
- There was a memory overrun in the TCPRead call when specifying a buffer length to be used and the available data exceeded this length when the socket was closed.
- There was a logic problem with processing TCP packets that arrived out of sequence. Marinetti ignored any incoming data if the socket was closed by the host before all packets had been processed.
- There was incorrect handling of escaped characters in the PPP link layers. Packets containing escaped characters failed the CRC check and the packet would be dropped. This would result in hangs, and loss of data when using the PPP link layers.
- LCPTerminateRequest was not supported by the PPP link layers. This would result in SysFail errors during negotiation of connections with some hosts.
- There was a pointer arithmetic bug in the TCP TimerData routine. This would result in SysFail errors within the PtrToPtr routine.
- There was a stack imbalance in UDPSyntax. Intermittent results.
- There were string parsing issues within TCPIPConvertIPToHex. Intermittent results.
- There was a pointer arithmetic bug in the delimiter routine used by TCPIPRead and TCPIPReadLine. This caused longer processing time when the delimiter was not in the data.
- There was incorrect handling of the rrMoreFlag in TCPIPRead. Intermittent results.
- There were stack imbalances in the TCP state machine handling. Intermittent results.
- There was incorrect handling of Echo responses. Attempts to Ping Marinetti would fail. Marinetti now responds to ping requests (however, only when an Application is being used).
Programming with Marinetti

Marinetti was written for the Apple II GS with Apple II GS programmers in mind. With this document, along with the supplied header and declaration files, your current development environment, and some minimal TCP/IP knowledge, you should be able to add TCP/IP facilities to your applications.

While previous knowledge of how TCP/IP and UNIX sockets work would be helpful, it is not mandatory for getting Marinetti support into your applications. This chapter should give newcomers enough information to get started, and those experienced with TCP/IP on other platforms a firm idea of how Marinetti differs from traditional UNIX socket implementations.

If you are already familiar with how TCP/IP works, you might like to skip ahead to the section “Calling Marinetti.”

What is TCP/IP

TCP/IP is actually two different pieces of software, yet they usually go together because applications on an internet use them in conjunction with one another.

The term internet, note the lower case “i”, refers to a networking protocol which allows computers to talk to each other in a fairly relaxed environment.

The term Internet, note the upper case “I”, refers to the most popular network in the world currently using the internet protocol.

An internet is usually explained using a network layer model. Although more detailed models are fairly common, this is the basic four layer model which they are derived from.

<table>
<thead>
<tr>
<th>Application</th>
<th>Telnet, FTP, Finger, Gopher, email etc.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport</td>
<td>TCP, UDP</td>
</tr>
<tr>
<td>Network</td>
<td>IP — ICMP, IGMP</td>
</tr>
<tr>
<td>Link</td>
<td>Device driver and interface card (SLIP, PPP etc.)</td>
</tr>
</tbody>
</table>

On the Apple II, there is another layer at the bottom for driving the serial ports or interface card.

This layering is usually referred to as a stack, thus the terminology, TCP/IP stack.

The link layer

For two computers on an internet to communicate, they need to be connected so they can send data back and forth. This is the link layer, named so because it looks after the two computers being linked together. It could be a simple direct cable connection, or a modem to modem connection. For personal computers
using modems, the most common protocols are SLIP, the Serial Line Internet Protocol, and PPP, the Point to Point Protocol.

SLIP is the most basic form of communication, and simply sends the data it is told to send, much like a telecom program does. A newer version of SLIP, called C/SLIP, for Compressed Serial Line Internet Protocol, compresses some of the data as it is transferred. The main problem with SLIP, is that there is no handshaking for the computers to send administrative information back and forth, such as connection tuning, compression options, and IP address management, leaving the user to provide a number of key pieces of information for the whole thing to work properly.

PPP, on the other hand, provides the same serial connection as SLIP, yet it includes compression, and basic handshaking. The handshaking lets the host tell the client what its IP address is, and which compression options to use.

The network layer

The next layer up, the network layer, is the backbone of the connection.

IP, the Internet Protocol, takes packets of information, called datagrams, and sends them between the various computers on the network.

Each computer in the network is allocated an address, called an IP address. Each datagram sent by IP contains the destination computer’s address. If there are a number of computers connected together, IP looks at the address in each datagram to decide which computer it is intended for.

Addresses are 32 bit numbers, but are usually expressed in the more readable dotted decimal notation, such as 255.102.10.103. Each of the four numbers contains 8 bits of the complete 32 bit address. When a datagram arrives, IP looks at the destination address in the datagram and decides whether it belongs to the computer it is running on. If not, it simply sends it on to the next computer in the network. This way datagrams hop from computer to computer until they arrive at the correct destination.

IP also has a facility where it can chop up large datagrams into fragments, which are really mini-datagrams. The fragments may take different paths to the destination, depending on the network loading, or other factors. When the fragments arrive at their destination, IP puts them all back together again as the original datagram, and the receiver never knows they were fragmented.

IP on its own is fairly unreliable, as it never knows whether a datagram it sent has actually reached its destination.

The application layer

Applications, such as email packages or Web browsers, simply open a direct path from themselves to the destination server. Imagine it as running a hose from the garden tap to the garden. Turn it on and the data comes flooding out in a continuous stream. In the case of a Web browser, we’re most likely talking about an HTML document, or a GIF/JPEG.

Once made, the connection will remain until the application decides to close it, or as in the garden hose example, it turns off the tap.
For Web browsers, a connection is opened and closed for each file, so in an HTML document that contains say four GIFs, the browser would first read the HTML document, then read each of the GIFs. In fact you can see this in action in Netscape Navigator as it draws the images as they are received. In fact, in Netscape Navigator there is a preference option for the maximum number of connections it may open simultaneously. The default is 4, as this seems to be the optimum amount on low speed serial connections.

This is also where multi-tasking or threading comes into play, as each of these is considered a separate task.

These connections are made and maintained by TCP, the Transmission Control Protocol.

**The transport layer**

TCP looks after management of the connection. You could think of it as the garden hose itself. It winds its way throughout the garden, delivering the continuous stream of water to its destination, making sure every drop arrives, and in the correct order.

TCP accepts a stream of data from the client or server and splits it up into segments. It then tells IP to send these segments to the destination.

IP encapsulates the segments within IP datagrams and sends them across the network. IP at the other end receives the datagrams and passes them to TCP as segments. TCP then starts rebuilding the original data stream.

As each IP datagram arrives, which may need to be rebuilt from fragments, TCP sends back another datagram that says “Yep! Got that one!” The sending TCP waits for these acknowledgement datagrams before continuing. The application however, simply sees it as a continuous stream of data.

And that’s the basics of TCP.

What makes TCP complex, is the timing. Segments, and therefore datagrams, must arrive and be acknowledged in a certain amount of time. If not, TCP resends the segment. If the acknowledgement gets lost, then the destination TCP may start receiving segments that it already has, causing unnecessary overheads.

TCP also uses windowing, which means it sends a number of datagrams at once, waits for responses and then sends another bunch. The ZMODEM file transfer protocol derives its efficiency from the same windowing technique.

Because IP datagrams and fragments may take different paths to the destination, segments may also arrive at their destination out of order, and the receiving TCP must wait and reorder them for the application. Indeed the fragments of a datagram may also arrive out of order, adding another level of complexity.
Using datastreams

The one problem with the garden hose analogy, is that unlike a garden hose, TCP connections may transport data in either direction at the same time. In effect, it is two garden hoses lying next to each other.

Any application using this continuous stream approach, is said to be using TCP/IP, because TCP is managing, or transporting, the data stream, and IP is handling all the underlying network management.

What the applications do with their stream of data is completely up to them. This may mean a number of connections, say one for telling the destination what to send, and another for the actual data being returned, or could be a simple question and answer type protocol utilising a single connection.

FTP, POP3, NNTP, SMTP, are all based on this connection stuff being run by TCP.

UNIX sockets

Most implementations of TCP/IP are considered to be a part of the operating system, whether it be UNIX, Mac OS, Amiga DOS, GS/OS, or whatever. For an application to use a TCP/IP connection, it needs a way to identify it, much like a file reference number identifies individual files open by an operating system. In the UNIX world, each connection is identified by a data structure called a socket.

The term socket may be used in a number of ways, so it is important that it is understood. At its most theoretical, a socket is the TCP connection, or data stream between the two computers. For example, in the Netscape Navigator example above, it would use five sockets, with probably four of them open at once, to read in the HTML document and its four GIFs.

Another use of the term socket, is at the application runtime level. Each TCP connection knows its source and destination by using an IP address to identify the computer, and a port number to identify a specific connection on that computer. A number of connections may share a port, so another unique number is used to identify each individual connection on the port. In UNIX TCP/IP implementations, a unique id for each connection on the computer is usually generated by concatenating the port number with the unique number. This unique id is called a socket, and is used by the application to uniquely identify each connection.

Port numbers are used on servers to help identify applications. For example, if a computer is running a Web server, then it is usually accessed through port 80. It may use other ports as well, or instead, but the standard port is 80. For the Web server to identify each connection to port 80, of which there may be many, it uses the socket assigned as described above.

There are other uses of the term socket, but these are the two main ones. Because there are so many uses for the term, it is not used within Marinetti. Marinetti instead uses an ipid to identify individual TCP connections. It is important to note that while most implementations do use the term socket, it is not actually included in the official TCP or IP specifications. It is purely an artifact of the UNIX world.

Applications make calls to the TCP/IP stack via socket calls, which are usually kept in a socket library, along with other operating system calls. With Marinetti, these calls are implemented as a tool set.
Other transport protocols

There are over 200 different protocols which use IP for datagram delivery, including TCP, UDP and ICMP. Some of these are proprietary, and some are publicly documented in RFCs.

Each IP datagram contains an indicator byte describing the protocol the datagram conforms to. This way, each protocol may have its own receive queue, and IP knows which queue the datagram should be dropped into.

UDP, is a basic datagram delivery protocol, where the application takes care of timeouts and reordering of data. ICMP is the administrative protocol which IP uses for returning timeout and network errors.

Calling Marinetti

Marinetti is a system tool, and as such will need to be loaded before use with the toolbox tool locator call _LoadOneTool(#54,#$200). Once loaded, you will need to call _TCPIPIStartUp to initialise the tool set. The tool locator calls _StartUpTools and _ShutDownTools do not as yet support the Marinetti tool set.

Connecting to the network

The first step, is to make a network connection. To see if the network is up, the application calls _TCPIPIGetConnectStatus, which returns a word indicating if the network is up.

If Marinetti is not yet connected to the network, the application may either make the connection itself by making a _TCPIPIConnect call, or issue a warning dialog indicating that the network is currently down. The _TCPIPIConnect call assumes that the user has set up Marinetti correctly using the TCP/IP CDev.

Obtaining an ipid

Once the network is up, the application may start making socket calls.

Each time you create a connection with a specific IP address and port number, no matter which protocol you wish to use, a 16 bit integer, called an ipid, is allocated by Marinetti to reference it. The ipid may then be used by your application to make requests to the connection, much like a GS/OS reference is used to reference files. To assign an ipid, you use the _TCPIPILogin call.

_T CPIPILogin accepts a number of parameters, most notably the destination IP address and port number, as well as a number of network performance variables. It returns the new ipid to you.

_T CPIPILogin also chooses a unique source port number, which can be examined using the _TCPIPIGetSourcePort call, and changed if necessary by calling _TCPIPISetSourcePort. If you wish to change the source port, you must do so immediately after logging in, or network connections may fail.
Opening a TCP connection

To open a TCP connection, call _TCPIPOpenTCP. This call accepts a single input, the ipid.

_TWOPIPOpenTCP simply tells Marinetti to start initiation of a connection. Keep in mind that it may take Marinetti some time to make the connection for you, depending on how busy the network is, and the speed of both the link layer and the Apple II GS it is running on.

The application then uses the _TCPIPStatusTCP call to check if the connection has been made. When srState becomes tcpsESTABLISHED, you’re done. If the state goes to tcpsCLOSED, then the connection failed.

Sending and receiving data

Once the TCP connection has been made, data may flow in either direction simultaneously, with Marinetti doing all the work for you.

To send data, the application calls _TCPIPWriteTCP. This call simply copies the data into an internal buffer, and initiates the send.

Again, the application must call _TCPIPStatusTCP to see when the data was transferred. When all the buffers have been emptied, srSndQueued will be nil.

To receive data, the application calls _TCPIPReadTCP. This call attempts to fill the user supplied buffer with data already received from the connection. The amount of data actually received is returned in rrBuffCount.

If the receive buffer cannot be completely filled, then no data is returned, unless the push flag was set by the sender.

_TWOPIReadTCP and _TCPIPReadLineTCP are the only TCP calls which immediately return with a result. All other TCP calls simply initiate an action and return.

Closing a TCP connection

If the application wishes to close a TCP connection, it calls _TCPICloseTCP. The close is queued, and won’t be initiated until all the data in the send buffer has been sent. Once the TCP connection has been closed, _TCPIPStatusTCP will indicate an srState of tcpsCLOSED.

If the other end of the connection issues a close first, then _TCPIPStatusTCP will indicate a number of varying close states. At this stage, the application may either make additional receive calls to empty out the receive buffer, or it may issue a close of its own to force the connection to close. Once closed, again the states will vary while the close is negotiated, and eventually the state will become tcpsTIMEWAIT.
The `tcpsTIMEWAIT` state will remain for quite a while, and is designed to let any lost segments expire before letting this `ipid` open another connection. Once the time wait period has elapsed, the state automatically becomes `tcpsCLOSED`.

In summary, both ends must issue direct close calls before the connection will close. If one end closes, the other end is still free to receive data before it too closes the connection. Once in the `tcpsCLOSED` state, all local data and control blocks have been purged.

**Releasing an `ipid`**

Once the application is finished with a particular destination IP address and port, it must call `_TCPIPLogout`, to release the assigned `ipid`. You may only logout the `ipid` if the TCP connection is in the `tcpsTIMEWAIT` or `tcpsCLOSED` state.

If the state is `tcpsTIMEWAIT`, the logout is queued for processing when Marinetti notices the state becomes `tcpsCLOSED`. In this case, the `ipid` is no longer available until the socket is closed.

**Disconnecting from the network**

If the application made the original network connection, it may wish to disconnect from the network as well. To do this, simply call `_TCPIPDisconnect`. In order to disconnect, every `ipid` must be logged out.

**How Marinetti obtains control**

Marinetti depends on a number of administrative tasks running concurrently, such as handling administrative duties and control of the underlying communications. To do this, it uses a RunQ entry.

However, if the RunQ is not active, because either it has been disabled, or the Event Manager has been shut down, Marinetti will choke with a backlog of tasks and data. Data will still be received, however it will not be acted upon. To fix this, there is a call named `_TCPIPpoll`, which the application should issue as often as possible. `_TCPIPpoll` checks the various pending Marinetti tasks and performs a set number of iterations of each, so the more often `_TCPIPpoll` is called, the faster the system throughput.

The standard way of calling `_TCPIPpoll`, is to simply add one `_TCPIPpoll` call inside the application’s main event loop, to be called when you receive a null event from the Event Manager (or Task Master).

However, it is much easier to simply let the RunQ task do everything for you. In fact, you can even issue `_TCPIPpoll` calls while the RunQ task is active, if you really wish to speed up throughput.

Finally, because different Apple IIgs systems have different speeds and loads, there are a number of tuning parameters available using the `_TCPIPGetTuningTable` and `_TCPIPSetTuningTable` calls.
Information on internet protocols (RFCs)

Protocol specifications are usually presented to the Internet public via RFCs, or Request For Comment documents. These documents are numbered and may be found on the InterNIC mail server.

To retrieve an RFC, send an email message to:

mailserv@ds.internic.net

Before replacing the xxx with the number of the RFC you wish to retrieve, the content of your message should read:

file /ftp/rfc/rfcxxx.txt

Alternatively, you could use one of the RFC HyperText Archives for search and retrieval, with all the RFCs interlinked using HTML. I tend to use one of the mirror sites, such as the following:

http://sunsite.auc.dk/RFC/

Here is a list of current RFCs for a number of internet protocols. These are by no means all.

<table>
<thead>
<tr>
<th>RFC</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>RFC977</td>
<td>NNTP</td>
</tr>
<tr>
<td>RFC1939</td>
<td>POP3 Post Office Protocol - Version 3</td>

Housekeeping tool calls

The following tool calls are mandatory tool locator calls.

TCPIPBootInit $0136

Initialises Marinetti.

⚠️ Warning This call must not be made by an application. ⚠

Parameters

The stack is not affected by this call.

Errors None

BASIC SUB TCPIPBootInit

C extern pascal void TCPIPBootInit (void);

Pascal procedure TCPIPBootInit;

TCPIPStartUp $0236

Starts Marinetti for use by an application. This call must be made by the application before making any other calls to Marinetti.

Parameters

The stack is not affected by this call.

Errors None

BASIC SUB TCPIPStartUp

C extern pascal void TCPIPStartUp (void);

Pascal procedure TCPIPStartUp;
**TCPIPShutDown** $0336

Shuts down Marinetti, once an application has finished with it.

**Parameters**

The stack is not affected by this call.

**Errors**

None

**BASIC**

SUB TCPIPShutDown

**C**

extern pascal void TCPIPShutDown (void);

**Pascal**

procedure TCPIPShutDown;

---

**TCPIPVersion** $0436

Returns the Marinetti version number. For Marinetti 2.0, the version returned is $0200.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Version information</th>
</tr>
</thead>
<tbody>
<tr>
<td>versionInfo</td>
<td>SP</td>
</tr>
</tbody>
</table>

**Errors**

None.

**BASIC**

FUNCTION TCPIPVersion as %

**C**

extern pascal Word TCPIPVersion (void);

**Pascal**

function TCPIPVersion: integer;
**TCPIPReset**

Resets Marinetti.

**Warning**  This call must not be made by an application. σ

**Parameters**

The stack is not affected by this call.

**Errors**

None

**BASIC**

SUB TCPIPReset

**C**

extern pascal void TCPIPReset (void);

**Pascal**

procedure TCPIPReset;

---

**TCPIPStatus**

Returns a boolean flag indicating whether or not Marinetti is active.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Boolean; TRUE if Marinetti is active</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>← SP</td>
</tr>
</tbody>
</table>

**Errors**

None.

**BASIC**

FUNCTION TCPIPStatus as %

**C**

extern pascal Boolean TCPIPStatus (void);

**Pascal**

function TCPIPStatus: boolean;

**activeFlag**

The value returned is TRUE (non-zero) if Marinetti is active, and FALSE ($0000) if it is not.
TCPIPLongVersion $0836

Returns the Marinetti rVersion number.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Long — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
<td>— SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Long — rVersion</th>
</tr>
</thead>
<tbody>
<tr>
<td>— rVersion —</td>
<td>— SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

FUNCTION TCPIPLongVersion as &

C

extern pascal Long TCPIPLongVersion (void);

Pascal

function TCPIPLongVersion: longint;
Administrative tool calls

The following calls deal with specific Marinetti administrative tasks.

---

**TCPIPGetConnectStatus**  
$0936$

Asks Marinetti if it is currently connected to the network.

**Parameters**

**Stack before call**

```
<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Space</th>
</tr>
</thead>
</table>
```

**Word** — Space for result

← SP

**Stack after call**

```
<table>
<thead>
<tr>
<th>Previous contents</th>
<th>connectedFlag</th>
</tr>
</thead>
</table>
```

**Word** — Boolean; TRUE if currently connected

← SP

**Errors**

None.

**BASIC**

```
FUNCTION TCPIPGetConnectStatus as %
```

**C**

```
extern pascal Boolean TCPIPGetConnectStatus (void);
```

**Pascal**

```
function TCPIPGetConnectStatus: boolean;
```

**connectedFlag**

The value returned is TRUE (non-zero) if Marinetti is currently connected to the network, and FALSE ($0000) if it is not.
TCPIPGetErrorTable

Returns a pointer to a list of longwords, Marinetti’s error table.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Long — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>— — Space —</td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Long — Pointer to error table</th>
</tr>
</thead>
<tbody>
<tr>
<td>— errTablePtr —</td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Errors

None.

</tbody>
</table>
TCPIPGetReconnectStatus $0B36

Asks Marinetti if there is enough information for it to dynamically reconnect to the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Boolean; TRUE if reconnect possible</th>
</tr>
</thead>
<tbody>
<tr>
<td>reconnectFlag</td>
<td>← SP</td>
</tr>
</tbody>
</table>

Errors

terrTCPIPNOTACTIVE  Marinetti is not active - probably in P8 mode

BASIC

FUNCTION TCPIPGetReconnectStatus as %

C

extern pascal Boolean TCPIPGetReconnectStatus (void);

Pascal

function TCPIPGetReconnectStatus: boolean;

reconnectFlag  The value returned is TRUE (non-zero) if Marinetti has enough information for it to reconnect to the network, and FALSE ($0000) if it has not.
If the Apple II GS crashes, or for whatever reason needs to be reboot, then Marinetti provides a reconnect facility, so it can dynamically reconnect without having to re-dial or renegotiate the connection, depending upon the connect method.

Reconnection assumes that there is enough internally saved information for Marinetti to reconnect (*see the TCPIPReconnectData $0B36 call*), such as a modem or similar connection device still being connected to the network, as well as Marinetti link management variables, which may have been saved to disk before the crash.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayPtr</td>
</tr>
</tbody>
</table>

**Long** — Pointer to message display routine

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
</table>

Errors

- **terrLINKERROR** — There was an error with the link. In the case of the built in serial ports, they may be in use by another product or AppleTalk
- **terrCONNECTED** — Marinetti is already connected
- **terrNORECONDATA** — There is no reconnect data available to perform the reconnect
- **terrLINKBUSY** — Modem or interface is busy
- **terrNOLINKINTERFACE** — No dial tone or similar
- **terrNOLINKRESPONSE** — No modem answer or similar
- **terrNORECONSUPPORT** — The link layer does not support reconnection
- **terrTCPINOTACTIVE** — Marinetti is not active - probably in P8 mode

**BASIC**

```
SUB TCPIPReconnect (displayPtr)
```

**C**

```
extern pascal void TCPIPReconnect (displayPtr);
```

**Pascal**

```
procedure TCPIPReconnect (dPtr: displayPtr);
```

**displayPtr** — This routine is called by Marinetti with various pstrings for display during the reconnection process. The routine must be available to be called for the duration of...
the TCPIPReconnect call. If you do not wish to display reconnection messages, pass displayPtr as nil.

The routine is called in full native, with 16 bit accumulator and index registers. The accumulator, index registers, data bank and direct page registers are undefined on entry. The data bank and direct page registers must be restored on exit. The pointer to the pstring is on the stack, and must be removed before returning.

◆ NOTE: Currently, for connections using the serial port, only a 19200 baud connection may be reconnected to. This request was added mainly as a developer facility, and corners were cut to provide it.
TCPIPGetMyIPAddress \( \text{SOF36} \)

Returns Marinetti’s IP address.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space — Long — Space for result</td>
</tr>
</tbody>
</table>

Stack after call

</tr>
</tbody>
</table>

BASIC

SUB TCPIPDisconnect(%displayPtr)

C

extern pascal void TCPIPDisconnect(Boolean, displayPtr);

Pascal

procedure TCPIPDisconnect(forceFlag: boolean; dPtr: displayPtr);

forceFlag

Ordinarily, the TCPIPDisconnect call will not disconnect unless every ipid has been logged out. This is so as not to interrupt network tasks waiting to be serviced. Remember, there may be more than one application running at a time, as well as NDAs and CDAs, which may be using the network as well. However, if the user knows that the pending ipids are either hung or can be forced, set this
flag to true and TCPIPDisconnect will forceably disconnect from the network.

Normal procedure would be to issue TCPIPDisconnect with forceFlag set to false. If a terrLOGINSPENDING error is returned, double check which ipids are still logged in, or ask the user if they wish to continue, then if all is OK, issue TCPIPDisconnect again with forceFlag set to true.

displayPtr This routine is called by Marinetti with various pstrings for display during the disconnection process. The routine must be available to be called for the duration of the TCPIPDisconnect call. If you do not wish to display disconnection messages, pass displayPtr as nil.

The routine is called in full native, with 16 bit accumulator and index registers. The accumulator, index registers, data bank and direct page registers are undefined on entry. The data bank and direct page registers must be restored on exit. The pointer to the pstring is on the stack, and must be removed before returning.
TCPIPGetMTU

Returns the current MTU (Maximum Transmission Unit), or the maximum IP datagram size. This value is set by the link layer module once it knows the host MRU (Maximum Receive Unit) size.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>

  Marinetti is not active - probably in P8 mode

**BASIC**

FUNCTION TCPIPGetConnectData (%, %) as conHandle

**C**

extern pascal conHandle TCPIPGetConnectData (Word,  
  Word);

**Pascal**

function TCPIPGetConnectData (userid: integer; method:  
  integer): conHandle;

**method**

The connect method. See the conXXX equates at the end of this document.

**conHandle**

The returned handle is now owned by the userid which was passed from  
  dataIn. Marinetti no longer owns or keeps track of this handle.
**TCPIPSetConnectData**  
$1736$

Passes Marinetti the connect data for the specified connect method.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td></td>
</tr>
<tr>
<td>conHandle</td>
<td></td>
</tr>
</tbody>
</table>

procedure TCPIPSetConnectData (method: integer; cHand: conHandle);
```

**method**

The connect method. See the conXXX equates at the end of this document.

**conHandle**

Handle containing the connect data

Once passed, the handle is owned by Marinetti and you must not perform any more actions on it.
TCPIPGetDisconnectData

Returns the disconnect data for the specified connect method.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
</tr>
<tr>
<td>userid</td>
</tr>
<tr>
<td>method</td>

TCPIPGetTuningTable $1E36

Returns the current tuning table.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— tunePtr — Long — Pointer to 10 byte buffer for tuning table</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— — &lt;- SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

```basic
SUB TCPIPGetTuningTable (tunePtr)

type tuneRecord
tcpTUNECOUNT as integer
tcpTUNEIPUSERPOLLCT as integer
tcpTUNEIPRUNQFREQ as integer
tcpTUNEIPRUNQCT as integer
tcpTUNETCPUSERPOLL as integer
end type
type tunePtr as pointer to tuneRecord

TCPIPGetTuningTable (tunePtr);
```

C

```c
extern pascal void TCPIPGetTuningTable (tunePtr);

typedef struct {
    Word tcpTUNECOUNT;
    Word tcpTUNEIPUSERPOLLCT;
    Word tcpTUNEIPRUNQFREQ;
    Word tcpTUNEIPRUNQCT;
    Word tcpTUNETCPUSERPOLL;
} tuneStruct, *tunePtr;

procedure TCPIPGetTuningTable (tPtr: tunePtr);
```

Pascal

```pascal
tuneRecord = record
tcpTUNECOUNT: integer;
tcpTUNEIPUSERPOLLCT: integer;
```
tcpTUNEIPRUNQFREQ: integer;
tcpTUNEIPRUNQCT: integer;
tcpTUNETCPUSERPOLL: integer;
end;
tunePtr = ^tuneRecord;

Points to a 10 byte buffer where the tuning table is to be returned.

The currently defined tuning table offsets are:

tcpTUNECOUNT +0000 The total length of the tuning table, in bytes, including tcpTUNECOUNT. Currently 10.
tcpTUNEIPUSERPOLLCT +0002 The number of datagrams Marinetti will build per TCPIP Poll request. The valid range is 1 through 10 inclusive. The default is 2.
tcpTUNEIPRUNQFREQ +0004 The RunQ frequency value (60ths of a second). The default is 30 (half a second).
tcpTUNEIPRUNQCT +0006 The number of datagrams Marinetti will build per RunQ dispatch. The valid range is 1 through 10 inclusive. The default is 2.
tcpTUNETCPUSERPOLL +0008 The TCP steps to perform per user, per TCPIP Poll request and RunQ dispatch. The valid range is 1 through 10 inclusive. The default is 2.
TCPIPS\textit{etTuningTable} \hspace{1cm} \$1F36

Replaces the current tuning table.

\textbf{Parameters}

Stack before call

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textit{Previous contents} & \textit{Long} \hspace{0.2cm} Pointer to new tuning table \\
\hline
\hline
\phantom{} & \textit{SP} \\
\hline
\end{tabular}

\begin{tabular}{|c|c|}
\hline
\textit{Previous contents} & \textit{SP} \\
\hline
\end{tabular}
\end{center}

\textbf{Errors} \hspace{0.2cm} \texttt{terrBADTUNETABLELEN} \hspace{0.2cm} Tune table length in Marinetti 2.0 must be 10

\textbf{BASIC} \hspace{0.2cm} \texttt{SUB TCPIPS\textit{etTuningTable} (tunePtr)}

\textbf{C} \hspace{0.2cm} \texttt{extern pascal void TCPIPS\textit{etTuningTable} (tunePtr);}

\textbf{Pascal} \hspace{0.2cm} \texttt{procedure TCPIPS\textit{etTuningTable} (tPtr: tunePtr);}

\textbf{tunePtr} \hspace{0.2cm} Points to a new tuning table, which Marinetti will copy into its internal tuning table. See \textit{TCPIPS\textit{etGetTuningTable}} for the definition of the tuning table structure.
TCPIPGetConnectMsgFlag

Returns the connect message flag, which tells the link layer module whether or not to display connect messages.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
</tr>
</tbody>
</table>

**Word** — Space for result

<— SP

Stack after call

<table>
<thead>

<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>conMsgFlag</td>
</tr>
</tbody>
</table>

**Word** — Boolean

<— SP

Errors

None.

BASIC

FUNCTION TCPIPGetConnectMsgFlag as %

c

extern pascal Boolean TCPIPGetConnectMsgFlag (void);

Pascal

function TCPIPGetConnectMsgFlag: boolean;

conMsgFlag The value returned is TRUE (non-zero) if link layer modules are to display connect messages, and FALSE ($0000) if they are not.
TCPIPSetConnectMsgFlag $4336

Tells Marinetti to tell link layer modules whether or not to display connect messages.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>conMsgFlag</th>
<th>Word — Boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>&lt;- SP</th>
</tr>
</thead>
</table>

Errors

None.

BASIC

SUB TCPIPSetConnectMsgFlag ()

C

extern pascal void TCPIPSetConnectMsgFlag (Boolean);

Pascal

procedure TCPIPSetConnectMsgFlag (flag: boolean);

conMsgFlag

The value is TRUE (non-zero) if link layer modules are to display connect messages, and FALSE ($0000) if they are not.
TCPIPGetUsername  $4436

Returns the current username.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— unBuffPtr —</td>
</tr>
</tbody>
</table>

| Long — Pointer to 51 byte response buffer |
| SP     |

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP</td>
</tr>
</tbody>
</table>

**Errors**

None.

**BASIC**

```basic
SUB TCPIPGetUsername (unBuffPtr)

type unBuff
    length as byte
    name(49) as char
end type

type unBuffPtr as pointer to unBuff

    char name[50];
} unBuff, *unBuffPtr;
```

**Pascal**

```pascal
procedure TCPIPGetUsername (uPtr: unBuffPtr);

unBuff = string[50];
unBuffPtr = ^unBuff;

unBuffPtr  
  Pointer to a 51 byte response buffer, for the returned username pstring.
```
TCPIPSetUsername

Sets the current username.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— usernamePtr —</td>
</tr>
</tbody>
</table>

Long — Pointer to username pstring

<— SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;— SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

SUB TCPIPSetUsername (usernamePtr)

C

extern pascal void TCPIPSetUsername (usernamePtr);

Pascal

procedure TCPIPSetUsername (name: usernamePtr);

usernamePtr

Usernames may contain a maximum of 50 characters.
TCPIPGetPassword $4636

Returns the user’s current password.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— pwBuffPtr — Long — Pointer to 51 byte response buffer</td>
</tr>
</tbody>
</table>

Stack after call

<table>

typedef struct {
    Byte length;
    char name[50];
} pwBuff, *pwBuffPtr;

Pascal

procedure TCPIPGetPassword (pPtr: pwBuffPtr);

pwBuff = string[50];
pwBuffPtr = ^pwBuff;

pwBuffPtr Pointer to a 51 byte response buffer, for the returned password pstring.
TCPIPSetPassword $4736

Sets the user’s password.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— passwordPtr —</td>
</tr>
</tbody>
</table>

Long — Pointer to password pstring

< SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
</table>

< SP

Errors

None.

BASIC

SUB TCPIPSetPassword (passwordPtr)

C

extern pascal void TCPIPSetPassword (passwordPtr);

Pascal

procedure TCPIPSetPassword (name: passwordPtr);

passwordPtr

Passwords may contain a maximum of 50 characters.
TCPIPGetLinkVariables $4A36

Returns a pointer to the variables maintained by the current link layer module.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
</tr>
<tr>
<td>Long — Space for result</td>
</tr>
<tr>
<td>&lt;- SP</td>

</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— variablesPtr —</td>
</tr>
<tr>
<td>Long — Pointer to variables</td>
</tr>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Errors

- terrNOCONNECTION: Not currently connected
- terrTCPINOTACTIVE: Marinetti is not active - probably in P8 mode

BASIC

```basic
FUNCTION TCPIPGetLinkVariables as variablesPtr
```

C

```c
extern pascal variablesPtr TCPIPGetLinkVariables (void);
```

Pascal

```pascal
function TCPIPGetLinkVariables: variablesPtr;
```

variablesPtr Points to the variables maintained by the current link layer module. The layout of the variables is described in the LinkGetVariables link layer module call.
TCPIPEditLinkConfig \hspace{1cm} $\$4B36$

Presents a window allowing the user to edit configuration parameters required by the link layer module. This call is currently only made by the Control Panel, but may be made by other applications which may wish to control Marinetti’s setup.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— connectHandle —</td>
</tr>
<tr>
<td>— disconnectHandle —</td>
</tr>
</tbody>
</table>

Long — Handle to connect data
Long — Handle to disconnect data

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>terrNOLINKLAYER</td>
<td>Unable to load link layer module for the selected connect method</td>
</tr>
<tr>
<td>terrBADLINKLAYER</td>
<td>Not a link layer module</td>
</tr>
<tr>
<td>terrBADENVIRONMENT</td>
<td>Either the desktop is not currently displayed, or the correct tools are not started.</td>
</tr>
<tr>
<td>terrTCPIPNOTACTIVE</td>
<td>Marinetti is not active - probably in P8 mode</td>
</tr>
</tbody>
</table>

BASIC

```
SUB TCPIPEditLinkConfig (Handle, Handle)
```

C

```
extern pascal void TCPIPEditLinkConfig (Handle, Handle);
```

Pascal

```
procedure TCPIPEditLinkConfig (connectHand: handle;
   disconnectHAnd: handle);
```

This call must be made while the desktop is displayed, as the code that presents the data to the user depends on certain tool sets to be already started. The complete list may found in the description of the LinkConfigure link layer module call later in this document.
TCPIPGetModuleNames $4C36

Returns a pointer to an array of linkInfoBlk records, indicating which link layer modules are available for use.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th>Long — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space</td>
<td>— Long</td>
<td>— SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th>Long — Pointer to module name list</th>
</tr>
</thead>
<tbody>
<tr>
<td>— moduleListPtr</td>
<td>— Long</td>
<td>— SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

FUNCTION TCPIPGetModuleNames as moduleListPtr

type module
    liMethodID as integer
    liName(20) as byte
    liVersion as long
    liFlags as integer
    liFilename(16) as byte
    liMenuItem(14) as byte
end type

type moduleListPtr as pointer to module

C

extern pascal ModuleListPtr TCPIPGetModuleNames (void);

typedef struct {
    Word liMethodID;
    char liName[21];
    Long liVersion;
    Word liFlags;
    char liFilename[16];
    Byte liMenuItem[14];
} module, (*moduleListPtr)[];
function TCPIPGetModuleNames: moduleListPtr;

module = record
  liMethodID: integer;
  liName: string[20];
  liVersion: longint;
  liFlags: integer;
  liFilename: string[15];
  liMenuItems: array[0..13] of byte;
end;

moduleList = array[0..99] of module;
moduleListPtr = ^moduleList;

moduleListPtr Points to an array of 64 byte extended linkInfoBlk records. The list is terminated by a nil word. Each record is defined as follows:

+00 liMethodID word The connect method. See the conXXX equates at the end of this document
+02 liName 21 bytes Pstring name of the module
+23 liVersion longword rVersion (type $8029 resource layout) of the module
+27 liFlags word Contains the following flags:

  bit15 This link layer uses the built in Apple II GS serial ports
  bits14-0 Reserved – set to zeros

+29 liFilename 16 bytes Pstring filename of the module
+45 liMenuItems 14 bytes rMenuItems template ready for use, which defines this connect method as a menu item

◆NOTE: The link layer module call LinkModuleInfo also refers to a linkInfoBlk, but with less entries in it. This is because Marinetti fills in the rest of the information itself before returning the records in the TCPIPGetModuleNames call.
TCPIPGetHostName

Returns the current host name.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Long — Pointer to 31 byte response buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>— hnBuffPtr —</td>
<td>—</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>← SP</th>
</tr>
</thead>
</table>

Errors

None.

BASIC

SUB TCPIPGetHostName (hnBuffPtr)

type hnBuff
   length as byte
   name(29) as byte
end type

type hnBuffPtr as pointer to hnBuff

C

extern pascal void TCPIPGetHostName (hnBuffPtr);

typedef struct {
   Byte length;
   char name[50];
} hnBuff, *hnBuffPtr;

Pascal

procedure TCPIPGetHostName (hPtr: hnBuffPtr);

hnBuff = string[30];
hnBuffPtr = ^hnBuff;

hnBuffPtr

Pointer to a 31 byte response buffer, for the returned host name pstring.

◆ NOTE: This call is provided for ease of porting of BSD applications. The default is set to "appleiigs" if no previous host name has been set. The MacIP link layer uses the host name to register the machine on the AppleTalk network when establishing a connection.
TCPIPSetHostName

Sets the current host name.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— hostNamePtr —</td>
</tr>
</tbody>
</table>

Long — Pointer to host name pstring

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— —</td>
</tr>
</tbody>
</table>

<- SP

Errors

None.

BASIC

SUB TCPIPSetHostName (hostNamePtr)

C

extern pascal void TCPIPSetHostName (hostNamePtr);

Pascal

procedure TCPIPSetHostName (hPtr: hostNamePtr);

hostNamePtr

Host names may contain a maximum of 30 characters.

◆ NOTE: This call is provided for ease of porting of BSD applications. The default is set to "appleiigs" if no previous host name has been set. The MacIP link layer uses the host name to register the machine on the AppleTalk network when establishing a connection.
TCPIPGetLinkLayer

Returns information about the module.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkInfoBlkPtr</td>
</tr>
</tbody>
</table>

Long — Pointer to buffer for response

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
</table>

<- SP

Errors

terrTCPIPNOTACTIVE  Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPGetLinkLayer (linkInfoBlkPtr)

type linkInfoBlk
    liMethodID as integer
    liName(20) as byte
    liVersion as long
    liFlags as integer
end type

type linkInfoBlkPtr as pointer to linkInfoBlk

C

extern pascal void TCPIPGetLinkLayer (linkInfoBlkPtr);

typedef struct {
    Word liMethodID;
    char liName[21];
    Long liVersion;
    Word liFlags;
} linkInfoBlk, *linkInfoBlkPtr;

Pascal

procedure TCPIPGetLinkLayer (libPtr: linkInfoBlkPtr);

linkInfoBlk = record
    liMethodID: integer;
    liName: string[20];
    liVersion: longint;
    liFlags: integer;
end record;
end;
linkInfoBlkPtr = ^linkInfoBlk;

linkInfoBlkPtr Points to a fixed length 27 byte response buffer as follows:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>liMethodID</td>
<td>word</td>
<td>The connect method. See the conXXX equates at the end of this document</td>

<td>bits14-1</td>
<td></td>
<td>Reserved – set to zeros</td>
</tr>
<tr>
<td></td>
<td>bit0</td>
<td></td>
<td>Indicates whether the module contains an rlcon resource</td>
</tr>
</tbody>
</table>
TCPIPGetAuthMessage $5736

Returns the authentication message returned from the link layer module during connection.

Parameters

Stack before call

```
<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
</tr>
<tr>
<td>— userid</td>
</tr>
</tbody>
</table>
```

Long — Space for result

Word — userID for Marinetti to use with NewHandle

<- SP

Stack after call

```
<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— authMsgHandle —</td>
</tr>
</tbody>
</table>
```

Long — Handle containing authentication message

<- SP

Errors

terrTCPIPNOTACTIVE  Marinetti is not active - probably in P8 mode

BASIC

FUNCTION TCPIPGetAuthMessage (%) as authmMsgHandle

C

extern pascal authmMsgHandle TCPIPGetAuthMessage (Word);

Pascal

function TCPIPGetAuthMessage (userID: integer): authmMsgHandle;

authMsgHandle If the current link layer supports authentication messages, then this handle will contain the ASCII text of the message sent by the host, else it will be empty. Either way, the handle belongs to the userid passed on the stack. The message may be for a successful or unsuccessful connection, and varies depending on the host system being used. It will always be less than 256 characters in length.
**TCPIPGetAliveFlag** $5A36

Returns the alive flag, which tells Marinetti whether to automatically keep the link alive.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>— Space for result</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>

</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

**Errors** None.

**BASIC**

FUNCTION TCPIPGetAliveFlag as %

**C**

extern pascal Boolean TCPIPGetAliveFlag (void);

**Pascal**

function TCPIPGetAliveFlag: boolean;

**aliveFlag**

The value returned is TRUE (non-zero) if Marinetti is to automatically keep the link alive, and FALSE ($0000) if it is not.
TCPIPSetAliveFlag  $5B36

Tells Marinetti whether to automatically keep the link alive.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>aliveFlag</td>
</tr>
</tbody>
</table>

Word — Boolean

<- SP

Stack after call

<table>

Pascal

procedure TCPIPSetAliveFlag (alive: boolean);

aliveFlag  The value is TRUE (non-zero) if Marinetti is to automatically keep the link alive, and FALSE ($0000) if it is not.
TCPIPGetAliveMinutes  $5C36

Returns how often Marinetti should present traffic to the network in an attempt to stop it disconnecting due to inactivity. The aliveFlag must be set to true to support this feature.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Space</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Word — Space for result</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>aliveMinutes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Word — Integer</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

FUNCTION TCPIPGetAliveMinutes as %

C

extern pascal Word TCPIPGetAliveMinutes (void);

Pascal

function TCPIPGetAliveMinutes: integer;

aliveMinutes The number of minutes between network checks. A value of zero also forces aliveFlag to false.
TCPIPSetAliveMinutes $5D36

Tells Marinetti how often to present traffic to the network in an attempt to stop it disconnecting due to inactivity. The aliveFlag must be set to true to support this feature.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>aliveMinutes</th>
<th>Word — Integer</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Stack after call

<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th>&lt;- SP</th>
</tr>
</thead>
</table>

Errors

terrBADALIVEMINUTES Minutes value is invalid

BASIC

SUB TCPIPSetAliveMinutes (%)

C

extern pascal void TCPIPSetAliveMinutes (Word);

Pascal

procedure TCPIPSetAliveMinutes (aliveMinutes: integer);

aliveMinutes A number from 1 to 999, indicating the number of minutes between network checks.
TCPIPGetBootConnectFlag $5F36

Returns the boot connect flag, which tells Marinetti whether to automatically connect to the network each time GS/OS is booted.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td></td>
</tr>
<tr>
<td>Word — Space for result</td>
<td></td>

</thead>
<tbody>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

SUB TCPIPSetBootConnectFlag (%)

C

extern pascal void TCPIPSetBootConnectFlag (Boolean);

Pascal

procedure TCPIPSetBootConnectFlag (bootConnect: boolean);

bootConnectFlag The value is TRUE (non-zero) if Marinetti is to automatically connect to the network, and FALSE ($0000) if it is not.
Domain Name Resolution

Domain names are what most people traditionally think of when giving an address for a machine on an internet. The problem is that the internet protocol requires you to address the machines with a numeric IP address rather than a domain name. Your machine is responsible for looking up the numeric IP address of the machine it wants to talk to before it can do so.

Domain names are purely administrative data, contained within a database on a server somewhere on the network, which applications must refer to when converting to and from the actual numeric IP addresses required by the network. Obviously Marinetti must start with a numeric IP address somewhere, and this is provided by calling TCPIPSetDNS with the numeric IP addresses of Domain Name Servers on the network you wish to use. Fields for this information are also provided in the CDev, and are saved with the preferences.

Once Marinetti knows which Domain Name Servers to use, the application may start converting domain names to numeric IP addresses by calling TCPIPDNRNameToIP.

Because the information for conversion is kept elsewhere on the network, looking up a domain name is not instantaneous, and the application may do other things while it is waiting for an answer. Therefore, making a TCPIPDNRNameToIP call initiates a request, and won't necessarily immediately return an answer. You can do whatever you want while you wait for a reply, just make sure you're either calling SystemTask (or TaskMaster) or TCPIPPoll every so often, to allow the resolver to do its job.

Once the call has been made, check the return buffer every so often. While the call is pending, the initial word, or DNR status code, will be set to DNR_Pending. Once the call has completed, this will change to something else, and if successful, your answer will have been returned.
TCPIPGetDNS  $1C36

Returns the IP addresses of the main and auxiliary Domain Name Servers.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— DNSRecPtr — Long — Pointer to response record</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>

    Long DNSMain;
    Long DNSAux;
} DNSRec, *DNSRecPtr;

Pascal

procedure TCPIPGetDNS (DNS: DNSRecPtr);

DNSRec = record
    DNSMain: longint;
    DNSAux: longint;
end;

DNSRecPtr = ^DNSRec;

DNSRecPtr Points to the response record. The layout is as follows:

+00 DNSMain longword  Main DNS IP address
<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+04</td>
<td>DNSAux</td>
<td>longword</td>
<td>Auxiliary DNS IP address</td>
</tr>
</tbody>
</table>
TCPIPSetDNS  $1D36

Sets the IP addresses of the main and secondary Domain Name Servers.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— DNSRecPtr — Long — Pointer to response record</td>
</tr>
<tr>
<td>— — — — — —</td>

</table>

Errors

None.

BASIC

SUB TCPIPSetDNS (DNSRecPtr)

C

extern pascal void TCPIPSetDNS (DNSRecPtr);

Pascal

procedure TCPIPSetDNS (DNS: DNSRecPtr);

DNSRecPtr

Points to the desired DNS record. The layout is as follows:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>longword</td>
<td>Main DNS IP address</td>
</tr>
<tr>
<td>+04</td>
<td>longword</td>
<td>Auxilliary DNS IP address</td>
</tr>
</tbody>
</table>
TCPIPCancelDNR  $2036

Cancels a pending request to the Domain Name Servers.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— dnrBufferPtr —</td>
</tr>
<tr>
<td>Long — Pointer to return buffer</td>
</tr>
<tr>

<tr>
<td>terrDNRBUSY</td>
<td>DNR is currently busy - try again later</td>
</tr>
<tr>
<td>terrTCPIPNOTACTIVE</td>
<td>Marinetti is not active - probably in P8 mode</td>
</tr>
</tbody>
</table>

BASIC

SUB TCPIPCancelDNR (DNRBufferPtr)

C

extern pascal void TCPIPCancelDNR (dnrBufferPtr);

Pascal

procedure TCPIPCancelDNR (dnr: dnrBufferPtr);

dnrBufferPtr The pointer to the return buffer indicates which request to cancel.
TCPIPDNRNameToIP $2136

Initiates a request to the Domain Name Servers, via Marinetti’s Domain Name Resolver, to look up an ASCII domain name and return it as a numeric IP address.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— nameptr — Long — Pointer to pstring domain name to look up</td>
</tr>
<tr>
<td>— dnrBufferPtr — Long — Pointer to return buffer</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;— SP</td>
</tr>
</tbody>
</table>

Errors

- terrNODNSERVERS No servers registered with Marinetti
- terrDNRBUSY DNR is currently busy - try again later
- terrTCPIPNOTACTIVE Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPDNRNameToIP (pStringPtr, DNRBufferPtr)

type dnrBuffer
  DNRstatus as integer
  DNRIPaddress as long
end type

type dnrBufferPtr as pointer to dnrBuffer

C

extern pascal void TCPIPDNRNameToIP (char *,
  dnrBufferPtr);

typedef struct {
  Word DNRstatus;
  Long DNRIPaddress;
} dnrBuffer, *dnrBufferPtr;

Pascal

procedure TCPIPDNRNameToIP (name: pstring; dnr:
  dnrBufferPtr);
dnrBuffer = record
    DNRstatus: integer;
    DNRIPaddress: longint;
end;
dnrBufferPtr = ^dnrBuffer;

dnrBufferPtr Points to the following DNR return buffer:

+00 DNRstatus   word         Current status of DNR for this request
+02 DNRIPaddress longword    Returned IP address

The DNRstatus codes are as follows:

<table>
<thead>
<tr>
<th>DNRstatus</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNR_Pending</td>
<td>$0000</td>
<td>Request is still being processed</td>
</tr>
<tr>
<td>DNR_OK</td>
<td>$0001</td>
<td>Your request completed successfully, and dnrBuffer contains the requested data</td>
</tr>
<tr>
<td>DNR_Failed</td>
<td>$0002</td>
<td>The request failed. Either the connection timed out, or some other network error</td>
</tr>
<tr>
<td>DNR_NoDNSEntry</td>
<td>$0003</td>
<td>Requested domain has no DNS entry</td>
</tr>
<tr>
<td>DNR_Cancelled</td>
<td>$0004</td>
<td>Cancelled by user</td>
</tr>
</tbody>
</table>
TCPIPGetDNRTimeouts

Returns the current DNR timeout values.

Parameters

Stack before call

Previous contents

— dnrdTimeoutsBuffPtr —
Long — Pointer to 4 byte buffer for response

<- SP

Stack after call

Previous contents

<- SP

Errors

None.

BASIC

SUB TCPIPGetDNRTimeouts (dnrTimeoutsBuffPtr)

type dnrTimeoutsRecord
  dnrdRETRIES as integer
  dnrdTIMER as integer
end type

type dnrTimeoutsBuffPtr as pointer to dnrTimeoutsRecord

C

extern pascal void TCPIPGetDNRTimeouts (dnrTimeoutsBuffPtr);

typedef struct {
  Word dnrdRETRIES;
  Word dnrdTIMER;
} dnrTimeoutsStruct, *dnrTimeoutsBuffPtr;

Pascal

procedure TCPIPGetDNRTimeouts (dtPtr: 
  dnrTimeoutsBuffPtr);
dnrTimeoutsRecord = record
  dnrRETRIES: integer;
  dnrTIMER: integer;
end;
dnrTimeoutsBuffPtr = ^dnrTimeoutsRecord;
dnrTimeoutsBuffPtr Points to a 4 byte buffer for the response.

The currently defined offsets are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Offset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnrRETRIES</td>
<td>+0000</td>
<td>How many times the DNR module retries both domain name servers. The default is 5.</td>
</tr>
<tr>
<td>dnrTIMER</td>
<td>+0002</td>
<td>The number of ticks before a retry times out. The default is 120 ticks (2 seconds).</td>
</tr>
</tbody>
</table>
TCPIPSetsDNRTTimeouts  $6836

Sets new DNR timeout values.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— dnrtTimeoutsBuffPtr —</td>
</tr>
<tr>
<td>Long — Pointer to new timeout values</td>
</tr>
<tr>
<td>← SP</td>

</tbody>
</table>

Errors

None.

BASIC

SUB TCPIPSetsDNRTTimeouts (dnrTimeoutsBuffPtr)

C

extern pascal void TCPIPSetsDNRTTimeouts (dnrTimeoutsBuffPtr);

Pascal

procedure TCPIPSetsDNRTTimeouts (dtPtr:
    dnrTimeoutsBuffPtr);

dnrTimeoutsBuffPtr  Points to new DNR timeout values, which Marinetti will copy into its internal DNR configuration.

See TCPIPGetsDNRTTimeouts for the definition of the buffer.
IP network tool calls

These calls provide access to network layer functions

TCPIPPoll $2236

Tells Marinetti to execute a set number of steps in all its pending tasks. See TCPIPGetTuneTable for more details.

Parameters

The stack is not affected by this call.

Errors

terrTCPINOTACTIVE  Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPPoll

C

extern pascal void TCPIPPoll (void);

Pascal

procedure TCPIPPoll;
TCPIPSendIPDatagram $4036

Sends a raw IP datagram across the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— datagramPtr —</td>
</tr>
</tbody>
</table>

Long — Pointer to the datagram to send

Stack after call

</tr>
</tbody>
</table>

Errors

| terrNOCONNECTION | Not currently connected to the network |
| terrTCPINOTACTIVE | Marinetti is not active - probably in P8 mode |

BASIC

SUB TCPIPSendIPDatagram (datagramPtr)

C

extern pascal void TCPIPSendIPDatagram (datagramPtr);

Pascal

procedure TCPIPSendIPDatagram (dPtr: datagramPtr);

This call assumes that the IP header has been formatted correctly with the appropriate length indicators, and uses this to determine the checksum and final datagram length. While the destination address must be embedded in the header, Marinetti will copy in its current IP address for you.
Network and Transport layer tool calls

These calls provide access to protocol functions of the network and transport layers, excluding TCP, which is described in its own section.

Most requests involve using an ipid, which is assigned when you login to Marinetti.

You may only make one connection of each type, such as TCP or UDP, per ipid.

TCPIPLogin

This is the initial login for a task, telling Marinetti the network destination, and IP management parameters. In return, Marinetti assigns a source port number, and returns you an ipid to use with subsequent calls.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Space</td>
<td></td>
</tr>
<tr>
<td></td>
<td>userid</td>
<td></td>
</tr>
<tr>

<td>destip</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td>destport</td>
<td></td>
</tr>
<tr>
<td></td>
<td>defaultTOS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>defaultTTL</td>
<td></td>
</tr>
</tbody>
</table>

Word — Space for result

Word — userID for Marinetti to use with NewHandle

Long — Destination IP address

Word — Destination port number

Word — Default Type Of Service

Word — Default Time To Live

← SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ipid</td>
<td></td>
</tr>
</tbody>
</table>

Word — ipid to use for subsequent calls

← SP

Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>terrIPIDTABLEFULL</td>
<td>There are too many connections already</td>
</tr>
<tr>
<td>terrNOCONNECTION</td>
<td>Not connected to the network</td>
</tr>
<tr>
<td>terrTCPINOTACTIVE</td>
<td>Marinetti is not active - probably in P8 mode</td>
</tr>
</tbody>
</table>

BASIC

FUNCTION TCPIPLogin (%, &, %, %, %, %) as %
C
extern pascal Word TCPIPLogin (Word, Long, Word, Word, Word)

Pascal
function TCPIPLogin (userID: integer; destip: longint; destport: integer; defaultTOS: integer; defaultTTL: integer): integer;
userid

This must be a valid Memory Manager userID, which Marinetti may use on your behalf when returning data to you. Handles returned which contain data, such as those from TCPIPReadTCP, will belong to you, and be allocated with this userID.

destIP

The destination IP address for all connections using this ipid. Some standard special case IP addresses are valid, such as 127.0.0.1, which is for loopback. Using the loopback address, or Marinetti’s current IP address, two applications on the same Apple II GS may talk to each other via a TCP connection.

destPort

The destination port for all connections using this ipid. Using a destination port of $0000, tells Marinetti to use this login as a service dispatcher for incoming connections.

defaultTOS

This is the initial TOS (“Type Of Service”) value to use for all IP services for this ipid. If unsure, use a value of $0000, which assigns equal priority to each TOS bit. The following are the valid bit flags, of which only one may be set at a time.

- %0001 0000  Minimise delay
- %0000 1000  Maximise throughput
- %0000 0100  Maximise reliability
- %0000 0010  Minimise monetary cost

defaultTTL

This is the initial TTL (“Time To Live”) value to use for all IP services for this ipid. If unsure, use a value of $0040, which means each IP datagram will hop at least 64 hosts before expiring. Values larger than $00FF will pinned to 255.

ipid

This is the value assigned to this destination/port pair. It must be supplied with any calls that access this connection.
**TCPIPILogout**

$2436

Tells Marinetti to logout this *ipid*, thus freeing all its control blocks, and making it available for subsequent **TCPIPIlogin** calls.

**Parameters**

Stack before call

```
+-------------------+           +---------------+           +---------------+
| Previous contents |           | Word — ipid to logout |
| ipid              |           | ← SP            |
+-------------------+           +---------------+           +---------------+
```

Stack after call

```
+-------------------+           +---------------+           +---------------+
| Previous contents |           | ← SP          |
+-------------------+           +---------------+           +---------------+
```

**Errors**

- **terrSOCKETOPEN**
  - This *ipid* still has a pending connection, and Marinetti will not log it out until the connection has closed/ended
- **terrNOCONNECTION**
  - Not currently connected to the network
- **terrBADIPID**
  - This *ipid* has not yet been logged in
- **terrTCPINOTACTIVE**
  - Marinetti is not active - probably in P8 mode

**BASIC**

```
SUB TCPIPIlogout (%)
```

**C**

```
extern pascal void TCPIPIlogout (Word);
```

**Pascal**

```
procedure TCPIPIlogout (ipid: integer);
```
**TCPIPSendICMP**

Sends an ICMP message datagram across the network.

### Parameters

**Stack before call**

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ipid</td>
</tr>
<tr>
<td></td>
<td>—</td>
</tr>
<tr>
<td>messagePtr</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td>messageLen</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Word</th>
<th>Connection to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long</td>
<td>Pointer to the ICMP message</td>
</tr>
<tr>
<td>SP</td>
<td>Length of the ICMP message</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Stack after call</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Previous contents</td>
<td>SP</td>
</tr>
</tbody>
</table>

### Errors

- **terrNOCONNECTION** Not currently connected to the network
- **terrBADIPID** This ipid has not yet been logged in
- **terrTCPIPNOTACTIVE** Marinetti is not active - probably in P8 mode

### BASIC

```bash
SUB TCPIPSendICMP (%, messagePtr, %)
```

### C

```c
extern pascal void TCPIPSendICMP (Word, messagePtr, Word);
```

### Pascal

```pascal
procedure TCPIPSendICMP (ipid: integer; mPtr: messagePtr; messageLen: integer);
```

**messagePtr** Points to just the ICMP message. Marinetti takes care of generating the correct checksum, encapsulating it in an appropriate IP datagram, and sending it across the network.

If sending echo request and echo reply messages, you must store your ipid as the message identifier, or instead use the TCPIPSendICMPEcho call, which was designed specifically for this purpose.

Ordinarily an ICMP datagram should have an IP header TOS value of 255 if performing network administration functions, so that the destination has the best possible chance of receiving the message. However, datagrams sent by TCPIPSendICMP use the current TOS value for the requested ipid.

TCPIPSendICMP automatically initialises and calculates the embedded ICMP checksum for you.
TCPIPSendUDP $2636

Sends a UDP datagram across the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
</tr>
<tr>
<td>—</td>
</tr>
<tr>
<td>udpPtr</td>
</tr>
<tr>
<td>—</td>
</tr>
<tr>
<td>udpLen</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Word</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Connection to use</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<tbody>
<tr>
<td>This ipid has not yet been logged in</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>terrTCPIPNOTACTIVE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marinetti is not active - probably in P8 mode</td>
</tr>
</tbody>
</table>

BASIC

SUB TCPIPSendUDP (%, udpPtr, %)

C

extern pascal void TCPIPSendUDP (Word, udpPtr, Word);

Pascal

procedure TCPIPSendUDP (ipid: integer; uPtr: udpPtr; udpLen: integer);

udpPtr

Points to just the UDP data. The UDP header is built for you inside Marinetti, encapsulated in an appropriate IP datagram, and sent across the network.
TCPIPGetDatagramCount

Returns the number of pending input datagrams for a specific ipid.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td><strong>Word</strong> — Space for result</td>
</tr>
<tr>
<td>ipid</td>
<td><strong>Word</strong> — Connection to use</td>
</tr>
<tr>
<td>protocol</td>
<td><strong>Word</strong> — Identifies the queue</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dgmCount</td>
<td><strong>Word</strong> — Count of datagrams in the queue</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

**Errors**
- **terrNOCONNECTION** — Not currently connected to the network
- **terrBADIPID** — This ipid has not yet been logged in
- **terrTCPIPNOTACTIVE** — Marinetti is not active - probably in P8 mode

**BASIC**

```basic
FUNCTION TCPIPGetDatagramCount (%%, %%) as %
```

**C**

```c
extern pascal Word TCPIPGetDatagramCount (Word, Word);
```

**Pascal**

```pascal
function TCPIPGetDatagramCount (ipid: integer;
    protocol: integer): integer;
```

**protocol**

The protocol of the packets in the queue. See the `protocolXXX` equates at the end of this document.
**TCPIPGetNextDatagram**  $2836$

Returns the next datagram for a specific protocol.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
<td>Long — Space for result</td>
</tr>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>

<td>Word — Return control flags</td>
</tr>
<tr>
<td>&lt;— SP</td>
<td></td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>— dgmHandle —</td>
<td>Long — Handle containing the datagram</td>
</tr>
<tr>
<td>&lt;— SP</td>
<td></td>
</tr>
</tbody>
</table>

**Errors**

- terrNOCONNECTION  Not currently connected to the network
- terrBADIPID      This ipid has not yet been logged in
- terrTCPIPNOTACTIVE  Marinetti is not active - probably in P8 mode

**BASIC**

```
FUNCTION TCPIPGetNextDatagram (%, %, %) as dgmHandle
```

**C**

```
extern pascal dgmHandle TCPIPGetNextDatagram (Word, Word, Word);
```

**Pascal**

```
function TCPIPGetNextDatagram (ipid, protocol, flags: integer): dgmHandle;
```

**protocol**

The protocol of the packets in the queue. See the protocolXXX equates at the end of this document. The values protocolICMP, protocolUDP and protocolTCP return entries from the ICMP, UDP and TCP queues respectively. Any other value will return the next IP queue entry.
flags Controls how the datagram is returned:

- Bit 15 controls the IP header; 0 = keep, 1 = remove
- Bit 14 controls the embedded header; 0 = keep, 1 = remove

Removing the embedded header also forces bit 15 to remove the IP header.

dgmHandle Contains the returned data, or is nil if there is no currently available datagram for that protocol.

◆ NOTE: For TCP, this request is primarily a test routine, left over from previous versions of Marinetti. Instead, TCP should be read using the appropriate TCP requests.
TCPIPGetLoginCount $2936

Returns the current number of Marinetti log ins.

Parameters

Stack before call

| Previous contents | Word — Space for result | ← SP |
| Space | |

Stack after call

| Previous contents | Word — Number of current log ins | ← SP |
| loginCount | |

BASIC

FUNCTION TCPIPGetLoginCount as %

C

extern pascal Word TCPIPGetLoginCount (void);

Pascal

function TCPIPGetLoginCount: integer;

Marinetti will not disconnect from the network while there are pending log ins. All TCPIPLLogin calls must be balanced with a TCPIPLLogout call.
TCPIPSendICMPEcho $2A36

Sends an ICMP echo request across the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
</tr>
<tr>
<td>seqNum</td>
</tr>
</tbody>
</table>

Word — Connection to use
Word — Sequence number
<- SP

</tr>
</thead>
<tbody>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Errors

- terrNOCONNECTION Not currently connected to the network
- terrBADIPID This ipid has not yet been logged in
- terrTCPINOTACTIVE Marinetti is not active - probably in P8 mode

BASIC

```basic
SUB TCPIPSendICMPEcho (%,%)
```

C

```c
extern pascal void TCPIPSendICMPEcho (Word, Word)
```

Pascal

```pascal
procedure TCPIPSendICMPEcho (pid, seqNum: integer);
```

seqNum The sequence number to include in the Echo request. This should ordinarily start at 1, and be incremented for each subsequent send.

This request builds an appropriate ICMP message, encapsulates it with an IP datagram, and sends it across the network. The ipid is used as the embedded identifier.

Ordinarily an ICMP datagram should have an IP header TOS value of 255 if performing network administration functions, so that the destination has the best possible chance of receiving the message. However, datagrams sent by TCPIPSendICMPEcho use the current TOS value for the requested ipid.
TCPIPReceiveICMPEcho  $2B36

Scans the ICMP protocol queue for the first echo reply message, deletes it, and returns its sequence number.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word — Space for result</td>
</tr>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>

</table>

BASIC

FUNCTION TCPIPReceiveICMPEcho (%) as %

C

extern pascal Word TCPIPReceiveICMPEcho (Word);

Pascal

function TCPIPReceiveICMPEcho (ipid: integer): integer;

seqNum The sequence number of the first echo reply message found in the ICMP queue.

◆ NOTE:  This request may return no echo replies, even though TCPIPGetDatagramCount says there are messages in the ICMP queue. This is because TCPIPGetDatagramCount counts all messages, not just the echo replies.
TCPIPStatusUDP $5336

Returns a number of variables relating to UDP.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>
</tr>
<tr>
<td>udpVarsPtr</td>
<td>Long — Pointer to variable response buffer</td>
</tr>
</tbody>
</table>

<— SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;— SP</td>
</tr>
</tbody>
</table>

Errors

- terrNOCONNECTION  Not currently connected to the network
- terrBADIPID      This ipid has not yet been logged in
- terrTCPIPNOTACTIVE  Marinetti is not active - probably in P8 mode

BASIC

```basic
SUB TCPIPStatusUDP (%, udpVarsPtr)

type udpVars
    uvQueueSize as integer
    uvError as integer
    uvErrorTick as long
    uvCount as long
    uvTotalCount as long
    uvDispatchFlag as integer
end type

type udpVarsPtr as pointer to udpVars
```

C

```c
extern pascal void TCPIPStatusUDP (Word, udpVarsPtr);

typedef struct {
    Word uvQueueSize;
    Word uvError;
    Long uvErrorTick;
    Long uvCount;
    Long uvTotalCount;
    Word uvDispatchFlag;
} udpVars, *udpVarsPtr;
```
Pascal

```pascal
procedure TCPIPStatusUDP (ipid: integer; uPtr: udpVarsPtr);

udpVars = record
  uvQueueSize: integer;
  uvError: integer;
  uvErrorTick: longint;
  uvCount: longint;
  uvTotalCount: longint;
  uvDispatchFlag: integer;
end;
udpVarsPtr = ^udpVars;
```

On return from the call, the response buffer looks like this:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>uvQueueSize</td>
<td>word</td>
<td>Number of entries in receive queue</td>

</tr>
<tr>
<td>+16</td>
<td>uvDispatchFlag</td>
<td>word</td>
<td>UDP dispatch flag</td>
</tr>
</tbody>
</table>

**uvError**

If an ICMP Port Unreachable Error was received, then bit15 will be set, and the remaining bits will contain an error code as follows:

- $8000$: Network unreachable
- $8001$: Host unreachable
- $8002$: Protocol unreachable
- $8003$: Port unreachable
- $8004$: Fragmentation needed but DF bit set
- $8005$: Source route failed
- $8006$: Destination network unknown
- $8007$: Destination host unknown
- $8009$: Destination network administratively prohibited
- $800A$: Destination host administratively prohibited
- $800B$: Network unreachable for TOS
- $800C$: Host unreachable for TOS

If an ICMP Time Expired Error was received, then bit15 will be set, and the remaining bits will contain an error code as follows:

- $8010$: TTL expired, never reached destination

**uvTotalCount**

This is the same value as that returned in the tcpDGMSUDP field of the error table.

**uvDispatchFlag**

This is the dispatchFlag boolean, which was set by the TCPIPSetUDPDispatch call, or false if not yet set. It indicates whether this
ipid can accept incoming UDP packets from different ports. destPort must also be set to $0000.
TCPIPSetUDPDispatch

Tells Marinetti whether this ipid is to be used for incoming UDP dispatch. To dispatch correctly, destPort must be set to $0000.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>
</tr>
<tr>
<td>dispatchFlag</td>
<td>Word — Indicates whether this ipid will dispatch</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>

</tr>
</tbody>
</table>

BASIC

```basic
SUB TCPIPSetUDPDispatch (%, %)
```

C

```c
extern pascal void TCPIPSetUDPDispatch (Word, Boolean);
```

Pascal

```pascal
procedure TCPIPSetUDPDispatch (ipid: integer;
                   dispatchFlag: boolean);
```

dispatchFlag The value is TRUE (non-zero) if Marinetti is dispatch incoming UDP datagrams to this ipid, and FALSE ($0000) if it is not.
TCP tool calls

These calls are the TCP specific socket functions, and are similar to the BSD socket interfaces available on UNIX systems. It should be noted that ipids using TCP may also use other protocols at the same time.

TCPIPOpenTCP $2C36

Initiates a TCP open request.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
</tr>
<tr>
<td>ipid</td>
</tr>
</tbody>
</table>

Stack after call

<table>

</thead>
<tbody>
<tr>
<td>tcpError</td>
</tr>
</tbody>
</table>

Error codes:
- **terrNOCONNECTION** – Not currently connected to the network
- **terrBADIPID** – This ipid has not yet been logged in
- **terrTCPIPNOTACTIVE** – Marinetti is not active - probably in P8 mode

BASIC

FUNCTION TCPIPOpenTCP (%) as %

C

extern pascal Word TCPIPOpenTCP (Word);

Pascal

function TCPIPOpenTCP (ipid: integer): integer;

tcpError

This will be one of the tcperr* equates.

This request initiates an open connection request, it does not complete the opening of the connection.

All successful TCPIPOpenTCP calls must be balanced at some stage with a successful TCPIPCloseTCP call.

**NOTE:** The current TOS and TTL values for the ipid are saved, and new preferred internal values for TCP are substituted.
TCPIPListenTCP $4E36

Initiates a TCP listen request, to listen for incoming connection initiations.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word — Space for result</td>
</tr>
<tr>
<td>ipid</td>

BASIC

FUNCTION TCPIPListenTCP (%) as %

C

extern pascal Word TCPIPListenTCP (Word);

Pascal

function TCPIPListenTCP (ipid: integer): integer;

tcpError This will be one of the tcperr* equates.

All successful TCPIPListenTCP calls must be balanced at some stage with a successful TCPIPCloseTCP call.

If the ipid has logged in with a non-zero destPort, then this listen request will only respond to incoming requests from that port number. Use a destPort of $0000 to catch all incoming requests.

◆NOTE: The current TOS and TTL values for the ipid are saved, and new preferred internal values for TCP are substituted.
TCPIPWriteTCP

$2D36

Writes data to the send queues, ready to be sent across a TCP connection.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td></td>
</tr>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>

Errors

- terrNOCONNECTION  Not currently connected to the network
- terrBADIPID      This ipid has not yet been logged in
- terrTCPNOTACTIVE Marinetti is not active - probably in P8 mode

BASIC

FUNCTION TCPIPWriteTCP (%) as %

cdataPtr, &, %, %)

C

extern pascal Word TCPIPWriteTCP (Word, dataPtr, Long, Boolean, Boolean);

Pascal

function TCPIPWriteTCP (ipid: integer; dPtr: dataPtr; dataLength: longint; pushFlag, urgentFlag: boolean): integer;

pushFlag

A boolean indicating whether to queue this with a local and destination push (TRUE – non-zero) or to queue as per normal (FALSE - $0000).
urgentFlag  A boolean indicating whether to interrupt normal transmission and queue this as urgent data (TRUE – non-zero) or to queue as per normal (FALSE - $0000).

tcpError  This will be one of the tcperr* equates.

This request returns immediately, after queuing the data. Marinetti will actually send the data when and as it is able to.

◆NOTE:  For those new to TCP programming, the urgentFlag parameter does not indicate that the data is simply urgent. It is a standard TCP function that initiates a number of events which may or may not include purging of data already in transit. It is advised not to use this parameter unless you fully understand the consequences. The pushFlag is also a standard TCP function, and while it will not purge data, you should be familiar with the concept of a TCP “push” before using it.
TCPIPReadTCP

Reads data from the TCP receive buffer, into a user buffer.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>

</tbody>
</table>

BASIC

FUNCTION TCPIPReadTCP (%, %, univ, &, rrBuffPtr) as %

    type rrBuffer
        rrBuffCount as long
        rrBuffHandle as handle
        rrMoreFlag as boolean
        rrPushFlag as boolean
        rrUrgentFlag as boolean
    end type

    type rrBuffPtr as pointer to rrBuffer
C

extern pascal Word TCPIPReadTCP (Word, Word, Ref, Long, rrBuffPtr);

typedef struct {
  Long rrBuffCount;
  Handle rrBuffHandle;
  Word rrMoreFlag;
  Word rrPushFlag;
  Word rrUrgentFlag;
} rrBuff, *rrBuffPtr;

Pascal

function TCPIPReadTCP (ipid, buffType: integer; data: univ longint; buffLen: longint; bPtr: rrBuffPtr): integer;

rrBuff = record
  rrBuffCount: longint;
  rrBuffHandle: handle;
  rrMoreFlag: boolean;
  rrPushFlag: boolean;
  rrUrgentFlag: boolean;
end;
rrBuffPtr = ^rrBuff;

buffType

  Describes the buffer type in buffData, and must be one of the following:

  $0000  buffData is a pointer to a buffer for the read data.
  $0001  buffData is a handle to contain the read data, and is resized by Marinetti to fit.
  $0002  buffData is ignored. A new handle is created, and returned containing the read data.

buffLength

  This is the maximum length of the read data. Marinetti will only read up to buffLen number of bytes into the buffer.

On return from the call, the requested 14 byte read response buffer is completed as follows:

+00  rrBuffCount  longword  Length of the returned data
+04  rrBuffHandle handle  Handle to the data
+08  rrMoreFlag  word  Is there more data received?
+10  rrPushFlag  word  Was this buffer pushed?
+12  rrUrgentFlag word  Is this urgent data?

rrBuffHandle

  Contains the handle to the data, only if buffType was $0002, and rrbuffCount > 0.

rrMoreFlag

  A boolean indicating whether there is any data left in the queue still to read (TRUE – non-zero) or this read has emptied the queue (FALSE - $0000).
rrPushFlag  A boolean indicating whether this data was pushed (TRUE – non-zero) or not (FALSE - $0000).

rrUrgentFlag  A boolean indicating whether this is urgent data (TRUE – non-zero) or not (FALSE - $0000).

tcpError  This will be one of the tcperr* equates.

When you issue a TCPIPReadTCP call, there are a number of logic steps which dictate how much data is actually read. The Marinetti logic goes roughly like this:

1. Check how much data we have actually received from the connection. This is our maximum return count, or maxrec.

2. See how much data the user is asking for, via the buffLength parameter.

3. Whichever is smallest out of buffLength and maxrec, becomes the amount to read, which becomes rrBuffCount.

4. Was there an rrPushFlag set inside the data stream from the head of the queue up until rrBuffCount? If so, rrBuffCount becomes the offset into the data stream of the end of the push, so only the pushed data is returned.

5. Return rrBuffCount bytes to the user.
TCPIPReadLineTCP  $5E36

Reads a line of data from the TCP receive buffer, into a user buffer.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word — Space for result</td>
</tr>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>

| terrTCPINOTACTIVE | Marinetti is not active - probably in P8 mode |
BASIC

FUNCTION TCPIPReadLineTCP (%, pstringPtr, %, univ, &,
                        rlrBuffPtr) as %

  type rlrBuff
    rlrBuffCount as long
    rlrBuffHandle as handle
    rlrIsDataFlag as boolean
    rlrMoreFlag as boolean
    rlrBuffSize as long
  end type

  type rlrBuffPtr as pointer to rlrBuff

C

extern pascal Word TCPIPReadLineTCP (Word, char *,
                                      Word, Ref, Long, rlrBuffPtr)

typedef struct {
  Long rlrBuffCount;
  Handle rlrBuffHandle;
  Word rlrIsDataFlag;
  Word rlrMoreFlag;
  Long rlrBuffSize;
} rlrBuff, *rlrBuffPtr;

Pascal

function TCPIPReadLineTCP (ipid: integer;
                           delimitStrPtr: pStringPtr;
                           buffTyp: integer; data: univ
                           longint; buffLen: longint; bPtr:
                           rlrBuffPtr): integer;

  rlrBuff = record
    rlrBuffCount: longint;
    rlrBuffHandle: handle;
    rlrIsDataFlag: boolean;
    rlrMoreFlag: boolean;
    rlrBuffSize: longint;
  end;
  rlrBuffPtr = ^rlrBuff;

  delimitStrPtr Points to a pstring to use as a line delimiter. Pushes and urgents are ignored, and
  the user buffer is only filled if the delimiter string has been received. If
delimitStrPtr is nil, then this call is routed to TCPIPReadTCP instead.

  If bit31 is set, then the delimiter is not stripped from the line before it is returned.

  All other parameters are the same as the TCPIPReadTCP call.
On return from the call, the requested 16 byte read response buffer is completed as follows:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>rlrBuffCount</td>
<td>longword</td>
<td>Length of the returned data</td>
</tr>
<tr>
<td>+04</td>
<td>rlrBuffHandle</td>
<td>handle</td>
<td>Handle to the data</td>
</tr>
<tr>
<td>+08</td>
<td>rlrIsDataFlag</td>
<td>word</td>
<td>Was a line actually read?</td>
</tr>
<tr>
<td>+10</td>
<td>rlrMoreFlag</td>
<td>word</td>
<td>Is there more data received?</td>
</tr>
<tr>
<td>+12</td>
<td>rlrBuffSize</td>
<td>longword</td>
<td>Required buffer size</td>
</tr>
</tbody>
</table>

If a `terrBUFFERTOOSMALL` error is returned, then the line was too large for the supplied buffer. The required size, whether the buffer was filled or not, is always returned in `rrBuffSize`.

It is possible for `rlrBuffCount` to be nil and `rlrIsDataFlag` to be true, indicating that a null line was read.
TCPIPCloseTCP

Issues a close of a connection.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Errors**

- terrNOCONNECTION — Not currently connected to the network
- terrBADIPID — This ipid has not yet been logged in
- terrTCPIPNOTACTIVE — Marinetti is not active - probably in P8 mode

**BASIC**

FUNCTION TCPIPCloseTCP (%) as %

**C**

extern pascal Word TCPIPCloseTCP (Word);

**Pascal**

function TCPIPCloseTCP (ipid: integer): integer;

**tcpError** — This will be one of the tcperr* equates.

Closing a connection involves handshaking across the network. As such, this call simply sets a flag indicating that Marinetti is to close the connection as soon as possible. Use the TCPIPStatusTCP call to check when the connection is finally CLOSED.

Closing state transition will normally go from CLOSING, which is set by TCPIPCloseTCP, through FINWAIT1 and FINWAIT2 while the close is negotiated by each end, on to TIMEWAIT and then finally CLOSED.

TIMEWAIT indicates that the connection is effectively closed as far as each end of the connection is concerned, and Marinetti is simply reserving the port so as to expire lost network datagrams. Once Marinetti is happy with making the port number available again, it will do so. The timeout period will vary depending on the network time, but will be a minimum of two minutes.
Again, the TCPIPStatusTCP call will tell you when the state has finally gone to CLOSED, but for all intents, unless you wish to use the same port number, TIMEWAIT indicates a successful close. You may issue a TCPIPLogout call in either TIMEWAIT or CLOSED state, and Marinetti will take care of the rest of the close for you.

When the connection finally closes (ie. CLOSED), Marinetti restores the original TOS and TTL values that were saved when the connection was opened, although if you have already logged out, this obviously won’t be an issue.
TCPIPAabortTCP  $3036

Forces a connection to abnormally close.

Parameters

} srBuff, *srBuffPtr;

Pascal
function TCPIPStatusTCP (ipid: integer; sPtr: srBuffPtr): integer;
srBuff = record
    srState: integer;
    srNetworkError: integer;
    srSndQueued: longint;
    srRcvQueued: longint;
    srDestIP: longint;
    srDestPort: integer;
    srConnectType: integer;
    srAcceptCount: integer;
end;
srBuffPtr = ^srBuff;

tcpError
This will be one of the tcperr* equates.

On return from the call, the requested status response buffer is completed as follows:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>srState</td>
<td>word</td>
<td>TCP state</td>
</tr>
<tr>
<td>+02</td>
<td>srNetworkError</td>
<td>word</td>
<td>ICMP error code</td>
</tr>
<tr>
<td>+04</td>
<td>srSndQueued</td>
<td>longword</td>
<td>Bytes left in send queue</td>
</tr>
<tr>
<td>+08</td>
<td>srRcvQueued</td>
<td>longword</td>
<td>Bytes left in receive queue</td>
</tr>
<tr>
<td>+12</td>
<td>srDestIP</td>
<td>longword</td>
<td>Destination IP address</td>
</tr>
<tr>
<td>+16</td>
<td>srDestPort</td>
<td>word</td>
<td>Destination port</td>
</tr>
<tr>
<td>+18</td>
<td>srConnectType</td>
<td>word</td>
<td>Connection type</td>
</tr>
<tr>
<td>+20</td>
<td>srAcceptCount</td>
<td>word</td>
<td>If in listen mode, number of pending incoming requests</td>
</tr>
</tbody>
</table>

srState  Indicates the current state of the TCP state machine. This will be one of the tcps* equates.

srNetworkError If the connection fails, normally indicated by the state going to tcpsTIMEWAIT or tcpsCLOSED, without application involvement, then the error code from an ICMP Port Unreachable Error message will indicate what caused the problem. Because $0000 is a valid error code, bit15 is used to indicate whether the error is relevant to this connection.
$8000  Network unreachable
$8001  Host unreachable
$8002  Protocol unreachable
$8003  Port unreachable
$8004  Fragmentation needed but DF bit set
$8005  Source route failed
$8006  Destination network unknown
$8007  Destination host unknown
$8009  Destination network administratively prohibited
$800A  Destination host administratively prohibited
$800B  Network unreachable for TOS
$800C  Host unreachable for TOS

If an ICMP Time Expired Error is received, then the segment is simply re–sent, in the hope that a shorter path may be found. This differs from UDP, where an error is reported back to the caller.

srConnectType  Indicates the type of connection that is open, and will be one of the following:

$0000  Active (client) connection (See TCPIPOpenTCP)
$0001  Passive (listen/server) connection (See TCPIPListenTCP)

srAcceptCount  Indicates the number of incoming requests queued if this is a passive connection.
TCPIPAcceptTCP

If a TCP connection in listen mode (see TCPIPListenTCP) has accepted an incoming connection request, then this call will create a new *ipid* to control the connection. The original *ipid* is left open, ready to accept more incoming requests.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
</tr>
<tr>
<td>ipid</td>
</tr>
<tr>
<td>reserved</td>
</tr>
</tbody>
</table>

- **Word** — Space for result
- **Word** — Connection to use
- **Word** — Reserved for future use. Use $0000
  \[<- SP\]

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>newipid</td>
</tr>
</tbody>
</table>

- **Word** — *ipid* of new connection
  \[<- SP\]

**Errors**

- terrNOCONNECTION — Not currently connected to the network
- terrBADIPID — This *ipid* has not yet been logged in
- terrNOINCOMING — There is no pending incoming request
- terrNOTSERVER — This *ipid* is not set up as a server
- terrTCPIPNOTACTIVE — Marinetti is not active - probably in P8 mode

**BASIC**

```basic
FUNCTION TCPIPAcceptTCP (%, %) as %
```

**C**

```c
extern pascal Word TCPIPAcceptTCP (Word, Word);
```

**Pascal**

```pascal
function TCPIPAcceptTCP (ipid, reserved: integer): integer;
```

If successful, TCPIPAcceptTCP implicitly issues TCPIPOpenTCP on the new *ipid*, and thus must be closed by the application when no longer required, by calling TCPIPCloseTCP. Likewise the actual listen request, initiated by TCPIPListenTCP, must also be closed by the application when no longer required, by calling TCPIPCloseTCP.
Transport administration tool calls

These calls deal with transport administration, such as parameters in control blocks, and transport layer performance functions.

**TCPIPGetSourcePort $3236**

Returns the current source port for the specified ipid.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
</tr>
<tr>
<td>ipid</td>
</tr>
</tbody>
</table>

- **Word** — Space for result

<td>— statistic —</td>
</tr>
</tbody>
</table>

| Long — Returned statistic |
| <- SP |

**Errors**

- terrNOCONNECTION: Not currently connected to the network
- terrBADIPID: This *ipid* has not yet been logged in
- terrBADPARAMETER: Invalid parameter for this call

**BASIC**

FUNCTION TCPIPGetUserStatistic (%, %) as &

**C**

extern pascal Long TCPIPGetUserStatistic (Word, Word);

**Pascal**

function TCPIPGetUserStatistic (ipid, statisticNum: integer): longint;

**statisticNum**

Indicates which statistic to return.

- $0001$ Number of data bytes (octets) received by the current or most recent TCP connection by this *ipid*
- $0002$ Number of data bytes (octets) sent by the current or most recent TCP connection by this *ipid*

**statistic**

The returned value depends upon the statistic requested.
TCPIPSetNewDestination

Sets a new destination IP address and port, which will take affect next time a connection is initiated.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
<td>Word — Connection to use</td>
</tr>
<tr>
<td>— destip</td>

<td>destport</td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

| Previous contents | ← SP |

Errors

- terrNOCONNECTION: Not currently connected to the network
- terrBADIPID: This ipid has not yet been logged in
- terrTCPIPNOTACTIVE: Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPSetNewDestination (%, &, %)

C

extern pascal void TCPIPSetNewDestination (Word, Long, Word);

Pascal

procedure TCPIPSetNewDestination (ipid: integer;  
destip: longint; destPort:  
integer);
TCPIPGetDestination

Returns the destination IP address and port which is being used for this ipid.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Connection to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipid</td>
<td>Long — Pointer to response record</td>
</tr>
<tr>

</thead>
</table>

Errors

terrNOCONNECTION Not currently connected to the network
terrBADIPID This ipid has not yet been logged in
terrTCPIPNOTACTIVE Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPGetDestination (%, destRecPtr)

type destRec
    drUserID as integer
    drDestIP as long
    drDestPort as integer
end type
type destRecPtr as pointer to destRec

C

extern pascal void TCPIPGetDestination (Word, destRecPtr);

typdef struct {
    Word drUserID;
    Long drDestIP;
    Word drDestPort;
} destRec, *destRecPtr;

Pascal

procedure TCPIPGetDestination (pid: integer; dPtr: destRecPtr);
destRec = record
  drUserID: integer;
  drDestIP: longint;
  drDestPort: integer;
end;
destRecPtr = ^destRec;

destRecPtr

  Points to the following response record:

+00  drUserID  word  UserID used by this ipid
+02  drDestIP  longword  Destination IP address
+06  drDestPort  word  Destination port number
Library type calls

These calls are typical of generic library functions, and do not directly deal with networking. They are primarily internal routines which may also be useful for developers.

TCPIPConvertIPToHex $0D36

Convert an ASCII text string representing a dotted decimal IP address, optionally followed by a comma delimited port number, into their equivalent number values.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— cvtRecPtr       — Long — Pointer to response record</td>
</tr>
<tr>
<td>— ddippstring     — Long — Pointer to dotted decimal address pstring</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

SUB TCPIPConvertIPToHex (cvtRecPtr, pstringPtr)

type cvtRec
    cvtIPAddress as long
    cvtPort as integer
end type

type cvtRecPtr as pointer to cvtRec

C

extern pascal void TCPIPConvertIPToHex (cvtRecPtr, char *);

typedef struct {
    Long cvtIPAddress;
    Word cvtPort;
} cvtRec, *cvtRecPtr;
Pascal

procedure TCPIPConvertIPToHex (cvt: cvtRecPtr; sPtr: pStringPtr);

cvtRec = record
    cvtIPAddress: longint;
    cvtPort: integer;
end;
cvtRecPtr = ^cvtRec;

cvtRecPtr  Points to the response record. The layout is as follows:

+00  cvtIPAddress  longword  Returned IP address
+04  cvtPort      word      Port number or nil if none

ddippstring  A pointer to a pstring containing an ASCII string for the dotted decimal address to convert.

If the dotted decimal IP address is followed by a “,” (comma) a “;” (colon) or a “;” (semi–colon) and then a number in the range 1 to 65535, then it will be returned as the port number. eg. “192.80.63.5:23” returns the Telnet port, which is 23.
TCPIPConvertIPCToHex  $3F36

Convert an ASCII text string representing a dotted decimal IP address, optionally followed by a comma delimited port number, into their equivalent number values.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— cvtRecPtr —</td>
</tr>
<tr>
<td>— ddipcstring —</td>
</tr>
</tbody>
</table>

- **Long** — Pointer to response record
- **Long** — Pointer to dotted decimal address cstring
- $<$ — SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>$&lt;$ — SP</td>
</tr>
</tbody>
</table>

Errors

None.

**BASIC**

SUB TCPIPConvertIPCToHex (cvtRecPtr, pstringPtr)

**C**

extern pascal void TCPIPConvertIPCToHex (cvtRecPtr, char *);

**Pascal**

procedure TCPIPConvertIPCToHex (cvt: cvtRecPtr; sPtr: pStringPtr);

cvtRecPtr  Points to the response record. The layout is as follows:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>cvtIPAddress</td>
<td>longword</td>
</tr>
<tr>
<td>+04</td>
<td>cvtPort</td>
<td>word</td>
</tr>
</tbody>
</table>

Error: Returned IP address

Port number or nil if none

ddipcstring  A pointer to a cstring containing an ASCII string for the dotted decimal address to convert.

If the dotted decimal IP address is followed by a “,” (comma) a “;” (colon) or a “;” (semi–colon) and then a number in the range 1 to 65535, then it will be returned as the port number. eg. “192.80.63.5:23” returns the Telnet port, which is 23.
TCPIPConvertIPToASCII \( S0E36 \)

Converts a longword IP address into a pstring ASCII text string of the dotted decimal equivalent.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
</tr>
<tr>
<td>ipaddress</td>
</tr>
<tr>
<td>ddpstring</td>
</tr>
<tr>

</tbody>
</table>

- **Word** — Space for result
- **Long** — The IP address to convert
- **Long** — Pointer to the 16 byte return buffer
- **Word** — Formatting flags
  
  `<--- SP`

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strlen</td>
</tr>
</tbody>
</table>

- **Word** — The length of the returned string
  
  `<--- SP`

**Errors**

None.

**BASIC**

FUNCTION TCPIPConvertIPToASCII (&, pstringPtr, %) as %

**C**

extern pascal Word TCPIPConvertIPToASCII (Long, char *, Word);

**Pascal**

function TCPIPConvertIPToASCII (ipaddress: longint;
  ddpstring: pString15Ptr; flags: integer): integer;

**flags**

Various formatting flags:

- Bit 15 is for ASCII type; 0 = low ASCII, 1 = high ASCII
TCPIPConvertIPToCASCII $5836

Converts a longword IP address into a zero terminated ASCII text string of the dotted decimal equivalent.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word</td>
</tr>
<tr>
<td>— ipaddress</td>
<td>Long</td>
</tr>

extern pascal Word TCPIPConvertIPToCASCII (Long, char *, Word);

Pascal

function TCPIPConvertIPToCASCII (ipaddress: longint;
  ddpstring: pString15Ptr; flags: integer): integer;

flags

Various formatting flags:

Bit 15 is for ASCII type; 0 = low ASCII, 1 = high ASCII
TCPIPConvertIPToClass

Returns the class of a given IP address.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td></td>
</tr>
<tr>
<td>— ipaddress —</td>
<td>Long — The IP address</td>

</thead>
<tbody>
<tr>
<td>class</td>
<td>← SP</td>
</tr>
</tbody>
</table>

Errors

None.

BASIC

FUNCTION TCPIPConvertIPToClass (&) as %

C

extern pascal Word TCPIPConvertIPToClass (Long);

Pascal

function TCPIPConvertIPToClass (ipaddress: longint):
  integer;

ipclass

The class of the returned IP address will be one of the following:

| $0000 | Class A |
| $0001 | Class B |
| $0002 | Class C |
| $0003 | Class D |
| $0004 | Class E |
**TCPIPMangleDomainName**

Takes an ASCII string as input, and modifies it for use as a syntactically correct domain name, which may be used as input to the DNR module.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word</td>
<td>Space for result</td>
</tr>
<tr>
<td>flags</td>

<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>Word</td>
</tr>
</tbody>
</table>

**Errors**

| terrTCPIPNOTACTIVE | Marinetti is not active - probably in P8 mode |

**BASIC**

FUNCTION TCPIPMangleDomainName (%, pstringPtr) as %

**C**

extern pascal Word TCPIPMangleDomainName (Word, char *);

**Pascal**

function TCPIPMangleDomainName (flags: integer;
    dnPstringPtr: pStringPtr): integer;

**flags**

Indicates which functions to perform. (Recommended = $F800):

- bit15 Remove port suffix
- bit14 Translate “%” tokens
- bit13 Conversion to lower case
- bit12 Delete illegal characters
- bit11 Strip off high bit
- bit10-bit0 Reserved – set to zeros

If all bits are set to zero, then the string will not be modified.

**dnPstringPtr**

A pointer to a pstring containing an ASCII string domain name.
If the domain name is followed by a “,” (comma) a “:” (colon) or a “;” (semi-colon) and then a number in the range 1 to 65535, then it will be returned as the port number, else it will be nil. eg. “delphi.com:23” returns the Telnet port, which is 23.
TCIPPPtrToPtr $5536

Copies memory in a forward direction from one location to another, optimised for speed.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— fromPtr — Long — Pointer to source data</td>
</tr>
<tr>
<td>— toPtr — Long — Pointer to destination data</td>

<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>validFlag</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Word — Boolean
<- SP

Errors

None.

BASIC

FUNCTION TCPIPValidateIPString (pstringPtr) as %

C

extern pascal Word TCPIPValidateIPString (char *);

Pascal

function TCPIPValidateIPString (sPtr: pStringPtr): boolean;

validFlag The value returned is TRUE (non-zero) if this is a valid pstring, or FALSE ($0000) if it is not.

This call does not interrogate the resultant IP address to see if it exists or is valid from a network administration standpoint. It simply checks to make sure it is a valid dotted decimal address. ie. four numeric arguments, each between 0 and 255 inclusive, delimited by decimal point symbols.
**TCPIPValidateIPCString**  $1536$

Returns a flag indicating whether the passed cstring is a valid ASCII representation of an IP address.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td></td>
<td></td>
</tr>
<tr>

function TCPIPValidateIPCString (sPtr: cStringPtr): boolean;

validFlag

The value returned is TRUE (non-zero) if this is a valid cstring, or FALSE ($0000$) if it is not.

This call does not interrogate the resultant IP address to see if it exists or is valid from a network administration standpoint. It simply checks to make sure it is a valid dotted decimal address. ie. four numeric arguments, each between 0 and 255 inclusive, delimited by decimal point symbols.
Link layer modules

Marinetti 3.0 supports several new link layer module calls, collectively known as link layer module version 2. To indicate support for these new calls, the link layer module should return the value $0002 from the LinkInterfaceV call.

Marinetti 3.0 ships with version 2 interface versions of all its link layer modules, and supports third party modules at both version 1 and 2.

Marinetti link layer modules are OMF files of file type $00BC and auxiliary type $00004083.

Once loaded, the module load point is used as a dispatch procedure, much like the toolbox, and is called with the accumulator and index registers long. Upon entry, the registers will be as follows:

A Module’s direct page if one was loaded as OMF, else $0000
X Call number
Y Marinetti UserID
(While loaded, modules are considered a part of Marinetti, and as such, all memory allocations must use Marinetti’s UserID, and not the module’s)
DBK Unknown
DP Marinetti’s direct page
S RTL address then parameters

If the module was built with its own direct page, then A will contain its address in bank 0. A value of $0000 indicates there is no direct page allocated and you should either allocate your own now, or use part of Marinetti’s. The direct page register will contain Marinetti’s direct page, on which you have exclusive access to offsets $E0-$FF. These locations will be preserved for you across calls, and so may be used for permanent variables while loaded and started.

On exit, A will contain a Marinetti error code in the terr_* range ANDed with terrmask, with the carry flag indicating any errors. The DBK and DP registers must be restored, and the stack fixed to remove the input parameters passed by the call.

How your module works is up to you, as long as it conforms to the calling interface. All of the included modules which use the serial port, allocate an internal interrupt buffer at LinkStartup time, and build datagrams from there each time LinkGetDatagram is called. However, there is nothing to stop a module building within an interrupt loop and queuing internally, or letting an external processor, such as a network card, do the work, so long as IP datagrams are returned to Marinetti via the LinkGetDatagram call.

Configuration data for link layer modules are stored within Marinetti, and applications may access them using the TCPIPGetConnectData, TCPIPSetConnectData, TCPIPGetDisconnectData and TCPIPSetDisconnectData tool calls. Additionally, they may be edited using the TCPIPEditLinkConfig call.

Link layer modules must be careful when changing the layout of their connect and disconnect data, as users may have an older versions currently installed. Modules should either include a version word at the beginning of the data, or be able to recognise earlier layouts of the data.
While Marinetti looks after saving the configuration data for each module, the data itself is private to the module concerned. For reference, the configuration data for SLIP and PPP (scripted) are currently defined as ASCII scripts, and all the rest that ship with Marinetti are proprietary.
**LinkInterfaceV**  $0000

Returns the maximum link layer module interface which this link layer module supports.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Interface version = $0001</th>
</tr>
</thead>
<tbody>
<tr>
<td>interfaceV</td>
<td>—</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

interfaceV The interface described in this document is $0001

**LinkStartup**  $0002

Starts the link layer module once it is loaded. The module should perform any initialisation tasks short of actually starting a connection.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>← SP</th>
</tr>
</thead>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>← SP</th>
</tr>
</thead>
</table>
LinkShutDown $0004

Marinetti will purge the module from memory, once this call has completed. The module has no choice in the matter.

**Parameters**

Stack before call

- Previous contents
- ← SP

Stack after call

- Previous contents
- ← SP
LinkModuleInfo $0006

Returns information about the module.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— linkInfoBlkPtr —</td>
</tr>
</tbody>
</table>

Long — Pointer to buffer for response

<— SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— — — — — — — — —</td>
</tr>
</tbody>
</table>

<— SP

linkInfoBlkPtr Points to a fixed length 27 byte response buffer as follows:

+00 liMethodID word The connect method. See the conXXX equates at the end of this document
+02 liName 21 bytes Pstring name of the module
+23 liVersion longword rVersion (type $8029 resource layout) of the module
+27 liFlags word Contains the following flags:

bit15       This link layer uses the built in Apple IIGS serial ports
bit14       This link layer is being executed in an emulator
bits13-1    Reserved – set to zeros
bit0        Indicates whether the module contains an rIcon resource
LinkGetDatagram $0008

Returns a raw data datagram from the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
</tr>
</tbody>
</table>

Long — Space for result

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— datagramHandle —</td>
</tr>
</tbody>
</table>

Long — Handle containing the datagram

<- SP

datagramHandle The handle must be allocated with Marinetti’s UserID, which was passed to the module during the call, and must contain a valid IP datagram, stripped of any underlying network headers. If there is no datagram waiting, then datagramHandle will be returned as nil.
LinkSendDatagram

Sends an IP datagram to the network via the module’s datagram encapsulation.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— datagramPtr —</td>
</tr>
<tr>
<td>datagramLength</td>
</tr>
</tbody>
</table>

Long — Pointer to the datagram data

Word — Length of the datagram to send

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
</table>

<- SP

The module should wrap the datagram in the appropriate datagram encapsulation, and send it to the network.
LinkConnect

Attempts to connect Marinetti to the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— authMsgHandle —</td>
</tr>
<tr>
<td>— conMsgFlag</td>
</tr>
<tr>
<td>— usernamePtr</td>
</tr>
<tr>
<td>— passwordPtr</td>
</tr>
<tr>
<td>— displayPtr</td>
</tr>
<tr>
<td>— conHandle</td>
</tr>
</tbody>
</table>

| Long | Handle for authentication message |
| Word | Boolean                           |
| Long | Pointer to username pstring       |
| Long | Pointer to password pstring       |
| Long | Pointer to message display routine |
| Long | Handle to the connect data        |

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

authMsgHandle
If the link layer supports an authentication method, then any optional authentication messages should be copied into this handle, which is supplied as initially empty. If the link layer does not support authentication messages, then the handle should simply be ignored. The data may then be retrieved by an application by using the TCPIPGetAuthMessage call.

This is one of Marinetti's permanent data handles and must remain valid. You may resize it as required, by using _SetHandleSize.

conMsgFlag
The value is TRUE (non-zero) if link layer modules are to display connect messages, and FALSE ($0000) if they are not.
displayPtr  Points to the calling applications message display routine. It is possible for conMsgFlag to be true, yet displayPtr is nil. The link layer module is expected to handle this situation correctly, and not issue any display call backs. The module is also completely in charge of calling the displayPtr routine, including any register preservation required. See TCPIPConnect for more details.

conHandle  The handle content must not be altered or purged, as it belongs to Marinetti.

Valid error codes are those returned by the TCPIPConnect tool call, ANDed with terrmask.

Once the link is active, the link layer must fill in the link layer variables (see LinkGetVariables call) correctly before returning.
LinkReconStatus \hspace{1cm} \text{S000E}

Returns a flag indicating whether the module is in a state to reconnect.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>\textbf{Word} — Space for result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{Space}</td>
<td>\textit{SP}</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>\textbf{Word} — Boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{reconStatus}</td>
<td>\textit{SP}</td>
</tr>
</tbody>
</table>

\text{reconStatus} \hspace{0.5cm} The value returned is TRUE (non-zero) if this link layer module is able to reconnect to the network, and FALSE (S0000) if it is not.
LinkReconnect $0010

Attempts to reconnect to the network, assuming the physical connection is still active, but the logical connection is not. An example would be a serial connection such as SLIP, where the modem is still connected to an ISP after a reboot, and the user wants to continue from where they left off.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>— displayPtr —</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Long — Pointer to message display routine</td>
</tr>
<tr>
<td></td>
<td>← SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>← SP</td>
</tr>
</tbody>
</table>

Modules do not have to support this call. It is provided primarily for developers to stay connected while testing. If not supported, simply return an error in the terr_* range, and ANDed with terrmask, indicating an appropriate problem with the link. The only variable (see the LinkGetVariables call) the link layer module should touch during this call, is lvConnected.

If a link layer module wishes to save its own data so it may better support the reconnect facility, it should write its data to a file in *:System:TCPIP:, preferably one named after the link layer, for example PPP.state.

Before LinkReconnect is called, Marinetti will store the reconnection IP address in lvIPaddress in case the link layer module requires it. There is no facility for using a different IP address on a reconnection.
LinkDisconnect $0012

Attempts to disconnect Marinetti from the network.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th>Word — Boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>conMsgFlag</td>
<td></td>
</tr>
<tr>
<td>usernamePtr</td>
<td>Long — Pointer to username pstring</td>
</tr>
<tr>
<td>passwordPtr</td>
<td>Long — Pointer to password pstring</td>
</tr>
<tr>
<td>displayPtr</td>
<td>Long — Pointer to message display routine</td>
</tr>
<tr>
<td>disconHandle</td>
<td>Long — Handle to the disconnect data</td>
</tr>
</tbody>
</table>

<— SP

Stack after call

<— SP

conMsgFlag  The value is TRUE (non-zero) if link layer modules are to display connect messages, and FALSE ($0000) if they are not.

displayPtr  Points to the calling application’s message display routine. See LinkConnect and TCPIPDisconnect for more details.

disconHandle The handle content must not be altered or purged, as it belongs to Marinetti.

Valid error codes are those return by the TCPIPDisconnect tool call, and ANDed with terrmask.

Before returning, the link layer module should set the lvConnected flag (see the LinkGetVariables call) appropriately. All other variables may be left as is, even though the link may have been dropped, and in fact may be used by Marinetti for post connection processing.
LinkGetVariables S0014

Returns a pointer to the link layer module’s variables.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space — Long — Space for result</td>
</tr>
<tr>
<td>SP</td>
</tr>
</tbody>
</table>

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— variablesPtr — Long — Pointer to variables</td>
</tr>
<tr>
<td>SP</td>
</tr>
</tbody>
</table>

variablesPtr Points to the following data block:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>word</td>
<td>lvVersion</td>
</tr>
<tr>
<td>+02</td>
<td>word</td>
<td>lvConnected</td>
</tr>
<tr>
<td>+04</td>
<td>longword</td>
<td>lvIPaddress</td>
</tr>
<tr>
<td>+08</td>
<td>longword</td>
<td>lvRefCon</td>
</tr>
<tr>
<td>+12</td>
<td>longword</td>
<td>lvErrors</td>
</tr>
<tr>
<td>+16</td>
<td>word</td>
<td>lvMTU</td>
</tr>
</tbody>
</table>

The above record must remain fixed in memory while the module is loaded.
LinkConfigure $0016

Presents a window allowing the user to edit configuration parameters required by the link layer module. This call is currently only made by the Control Panel, but may be made by other applications which may control Marinetti’s setup.

Parameters

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— connectHandle —</td>
</tr>
<tr>
<td>— disconnectHandle —</td>
</tr>
</tbody>
</table>

Long — Handle to connect data

Long — Handle to disconnect data

<- SP

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

This call passes two handles that contain the connect and disconnect data respectively. The handles may be resized and edited as required. If either of the handles are empty, then there is currently no configuration data, and the handle should be resized and initialised before presenting any dialogs to the user.

When called, the desktop will be displayed, and the following tool sets will guarantee to have been started. Other tool sets may have also been started, but the module should check before using them and start them if necessary, and shut them down again on exit.

<table>
<thead>
<tr>
<th>Tool Set Name</th>
<th>Tool Set No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tool Locator</td>
<td>#01 $01</td>
</tr>
<tr>
<td>Memory Manager</td>
<td>#02 $02</td>
</tr>
<tr>
<td>Miscellaneous Toolset</td>
<td>#03 $03</td>
</tr>
<tr>
<td>Quickdraw II</td>
<td>#04 $04</td>
</tr>
<tr>
<td>Event Manager</td>
<td>#05 $05</td>
</tr>
<tr>
<td>Integer Math Toolset</td>
<td>#11 $0B</td>
</tr>
<tr>
<td>Text Toolset</td>
<td>#12 $0C</td>
</tr>
<tr>
<td>Window Manager</td>
<td>#14 $0E</td>
</tr>
<tr>
<td>Menu Manager</td>
<td>#15 $0F</td>
</tr>
<tr>
<td>Control Manager</td>
<td>#16 $10</td>
</tr>
<tr>
<td>System Loader</td>
<td>#17 $11</td>
</tr>
<tr>
<td>Quickdraw II Auxilliary</td>
<td>#18 $12</td>
</tr>
</tbody>
</table>
LineEdit Toolset   #20  $14
Dialog Manager    #21  $15
Scrap Manager     #22  $16
TCP/IP            #54  $36

◆ NOTE:  The module's resource fork is not available during calls to the module. Attempts by a module to open its resource fork may cause the module and Marinetti to crash.
The configuration data for link layer modules is stored in the resource fork of a single configuration file inside the TCPIP folder. While Marinetti starts and shuts down the Resource Manager as required, this could cause excessive CPU overhead as well as data corruption due to bugs in the Resource Manager.

In future Marinetti will store configuration data in a file for each link layer module.

This call returns the filename of the configuration file as defined by the link layer module.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— configNamePtr —</td>
</tr>
</tbody>
</table>

| Long — Pointer to response buffer |
| SP |

Stack after call

<table>
<thead>
<tr>
<th>Previous contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>— — — — — — — —</td>
</tr>
</tbody>
</table>

| configNamePtr |
| Pointer to a 16 byte buffer into which the ProDOS filename will be returned as a pString. |
Outward bound notifications

It may be useful for some applications to be notified asynchronously when certain events occur within Marinetti, such as the network going up and down. Marinetti provides this facility via System 6 IPC requests.

An application that wishes to receive requests sent by Marinetti, should first call the Tool Locator tool set call _AcceptRequests with a nameString such as TCP/IP~CompanyName~ProductName~. CompanyName is the name of your company and ProductName is the name of your product. Marinetti sends its requests to every application with a nameString beginning with TCP/IP.

The requests which Marinetti sends out should not be accepted by your routine. They are informational only.

<table>
<thead>
<tr>
<th>TCPIPSaysHello</th>
<th>$8101</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marinetti sends this request once it has completed its startup procedure.</td>
<td></td>
</tr>
<tr>
<td>dataIn is reserved</td>
<td></td>
</tr>
<tr>
<td>dataOut is reserved</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TCPIPSaysNetworkUp</th>
<th>$8102</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marinetti sends this request immediately a network connection is made.</td>
<td></td>
</tr>
<tr>
<td>dataIn is a pointer to the following data buffer:</td>
<td></td>
</tr>
<tr>
<td>+00  inwLength  integer  Length of buffer, including this, is $000E</td>
<td></td>
</tr>
<tr>
<td>+02  inwIP      longword  Your IP address</td>
<td></td>
</tr>
<tr>
<td>+06  inwMethod  integer  The connect method currently being used</td>
<td></td>
</tr>
<tr>
<td>+08  inwMTU     integer  The MTU currently being used</td>
<td></td>
</tr>
<tr>
<td>+10  inwLVPtr   longword  Pointer to link layer variables currently being used</td>
<td></td>
</tr>
</tbody>
</table>

| dataOut is reserved |
Marinetti sends this request immediately after it has disconnected from the network.

dataIn is a pointer to the following data buffer:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00</td>
<td>inwCount</td>
<td>integer</td>
<td>Length of buffer, including this, is $000E</td>
</tr>
<tr>
<td>+02</td>
<td>inwIP</td>
<td>longword</td>
<td>The IP address which was being used</td>
</tr>
<tr>
<td>+06</td>
<td>inwMethod</td>
<td>integer</td>
<td>The connect method which was being used</td>
</tr>
<tr>
<td>+08</td>
<td>inwMTU</td>
<td>integer</td>
<td>The MTU which was being used</td>
</tr>
<tr>
<td>+10</td>
<td>inwLVPtr</td>
<td>longword</td>
<td>Pointer to link layer variables which were being used</td>
</tr>
</tbody>
</table>

dataOut is reserved

◆ NOTE: The link layer module which was being used will be purged from memory after this request, so you should save off any parameters you will need from the link layer variables before returning.
Event triggers

Marinetti version 3.0 introduces event triggers, which allow programs to receive synchronous signalling from the TCP/IP stack for specific system and ipid events.

Event triggers may be installed for system events, or for each individual ipid. When the trigger “fires”, it calls a routine in your program to indicate that the event occurred, passing several parameters on the stack. The routine is called with the accumulator and index registers long, the direct page register pointing to the Marinetti direct page, and the data bank register undefined. Upon return, the direct page and data bank registers must be preserved.

Before the call, the stack will look like this:

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>Word — Space for result</td>
</tr>
<tr>
<td>triggerNumber</td>
<td>Word — The number of the trigger which fired</td>
</tr>
<tr>
<td>ipid</td>
<td>Word — ipid or $0000 for system</td>
</tr>
<tr>
<td>— triggerParm</td>
<td>Long — Parameter depending upon the trigger</td>
</tr>
<tr>
<td>—</td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

Before returning, the stack should look like this:

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>actionCode</td>
<td>Word — Parameter depending upon the trigger</td>
</tr>
<tr>
<td>—</td>
<td>&lt;- SP</td>
</tr>
</tbody>
</table>

triggerNumber — The number of the trigger which fired.

ipid — The ipid of the trigger which fired. If this is a system event trigger, then this value is $0000.

triggerParm — A longword dependent upon the trigger which fired. See the trigger descriptions below for more details.

actionCode — An optional parameter word returned to Marinetti indicating what it should do upon return from the trigger routine. In most cases, this parameter is unused and should be left on the stack unchanged.

Marinetti is not fully re–entrant, hence trigger routines must not call any additional Marinetti routines. In most cases, the trigger routine shall simply set a flag and return, with the main application logic detecting the flag being set and taking appropriate action within the main event loop.
Additionally, most triggers will fire within critical code within Marinetti, and the less instruction cycles used in your routine, the better.

Triggers are automatically removed from the system when the ipid is logged out.

**User event triggers**

<table>
<thead>
<tr>
<th>Trigger:</th>
<th>$0001</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger name:</td>
<td>trgUDPIn</td>
</tr>
<tr>
<td>triggerParm:</td>
<td>Handle to the UDP datagram.</td>
</tr>
<tr>
<td>actionCode:</td>
<td>$0000 = Take no further action. <em>Default.</em> $0001 = Application now owns the handle.</td>
</tr>
</tbody>
</table>

A UDP datagram was received. If actionCode is set to $0001 upon return, then Marinetti assumes that the application now owns the handle, and will not add it to the incoming UDP queue. Applications wishing to keep the datagram must immediately set the handle’s userid field to their own.

**System event triggers**

Multiple applications may attempt to set a system trigger at the same time. To avoid this, applications should first check to see if a trigger is already installed, using TCPIPGetSysEventTrigger, before installing their own.

<table>
<thead>
<tr>
<th>Trigger:</th>
<th>$0001</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger name:</td>
<td>strgNetworkDown</td>
</tr>
<tr>
<td>Description:</td>
<td>Marinetti has just disconnected from the network, or has just detected that the network is already down.</td>
</tr>
<tr>
<td>triggerParm:</td>
<td>undefined.</td>
</tr>
<tr>
<td>actionCode:</td>
<td>undefined.</td>
</tr>
</tbody>
</table>
TCPIPGetUserEventTrigger $6336

Returns the requested user event trigger.

**Parameters**

Stack before call

<table>
<thead>
<tr>
<th>Previous contents</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>— Space —</td>
<td>Long — Space for result</td>
</tr>
<tr>
<td>triggerNumber</td>

terrTCPIPNOTACTIVE Marinetti is not active - probably in P8 mode

BASIC

SUB TCPIPSetSysEventTrigger (%, triggerProcPtr)

C

extern pascal void TCPIPSetSysEventTrigger (Word, triggerProcPtr);

Pascal

procedure TCPIPSetSysEventTrigger (triggerNumber: integer; tPtr: triggerProcPtr);

triggerProcPtr Address of the routine to be called by Marinetti when the trigger is fired.

The routine is called in full native mode, with 16 bit accumulator and index registers. The direct page register points to the Marinetti direct page, and the data bank register is undefined. Upon return, the direct page and data bank registers must be preserved.
Debugging and testing

Previous versions of Marinetti were called using the toolbox IPC interface, and supported a number of built-in debugging requests. A test application called TESTER was also included with the Marinetti Developers’ Kit to make it easier to test requests. Unfortunately, this was in Merlin source code, making it difficult for ORCA/M programmers to make their own changes. There were also no test utilities for high level compiled languages.

From Marinetti version 2.0 onwards, all calls are made using the toolbox interface. This makes debugging and testing a lot easier, by using Dave Lyons’ Nifty List. The NList.Data file contains the call syntax and error codes for tool calls, and is easily modified to allow you to issue Marinetti tool calls from the Nifty List command line.

As the Nifty List solution is neater, easier to use, and language independent, the original TESTER application is no longer included or supported. Also, due to the abundance of utilities which provide tool breaks, such as Apple’s GSBug, a number of break point debugging requests have also been removed.

Nifty List

To add Marinetti support to Nifty List, load the NList.Data file into a text editor, and make the following changes.

Find the line starting “2E26 MCSetVolume(…” and add the following after it:

```
0036 === Marinetti ===
0136 TCPIPBootInit()
0236 TCPIPS/startUp()

3621 terrBADTRIGGERNUM

A file containing the above Nifty List configuration for Marinetti can be found in the Marinetti Open Source Project CVS Repository:

http://marinetti.cvs.sourceforge.net/marinetti/MOSP/Tools/NiftyList/nl.marinetti

If you have an older version of NList.Data or are still using Apple’s internal beta test NList.AppleData (which should no longer be used), then you will need to find the appropriate lines yourself.

Once the changes have been made, save them back to disk and reboot. You should now be able to issue Nifty List commands against the Marinetti tool calls and error codes. If issuing calls outside of your application, you will most likely need to use Nifty List to issue the _LoadOneTool(36,200) call first.
GSBug

GSBug has the ability to view data structures in memory by using templates. A template file for Marinetti can be found in the Marinetti Open Source Project CVS Repository:

For ease of access, you may wish to copy the template file to your *:System:System.Setup directory.

Refer to the GSBug documentation for more information on how to use this file.
Porting from BSD UNIX

In order to ease porting from code using BSD socket interfaces, the following is a list of BSD system calls and library functions, and the closest, if any, Marinetti call which performs the same or a similar function.

<table>
<thead>
<tr>
<th>BSD call/function</th>
<th>Marinetti equivalent</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept</td>
<td>TCPIPAcceptTCP</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>bind</td>
<td>TCPIPILogin</td>
<td>This function is duplicated by issuing the two Marinetti calls in order</td>
</tr>
<tr>
<td></td>
<td>TCPIPListenTCP</td>
<td></td>
</tr>
<tr>
<td>close</td>
<td>TCPIPCloseTCP</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>connect</td>
<td>TCPIPSetNewDestinationTCP</td>
<td>There is no direct way to duplicate this function</td>
</tr>
<tr>
<td></td>
<td>TCPIPOpenTCP</td>
<td></td>
</tr>
<tr>
<td>gethostbyaddr</td>
<td></td>
<td>There is no way to duplicate this function</td>
</tr>
<tr>
<td>gethostbyname</td>
<td>TCPIPDNRNameToIP</td>
<td>While not as detailed, these calls are functionally equivalent</td>
</tr>
<tr>
<td>gethostid</td>
<td>TCPIPGetMyIPAddress</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>gethostname</td>
<td>TCPIPGetHostName</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>getpeername</td>
<td></td>
<td>There is no direct way to duplicate this function</td>
</tr>
<tr>
<td>listen</td>
<td>TCPIPListenTCP</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>read</td>
<td>TCPIPReadTCP</td>
<td>These calls are functionally equivalent</td>
</tr>
<tr>
<td>recv, recvfrom,</td>
<td>TCPIPGetNextDatagram</td>
<td>While functionally equivalent, the Marinetti call is more flexible, as it is a generic call for other transport layers as well as UDP</td>
</tr>
<tr>
<td>recvmsg</td>
<td></td>
<td></td>
</tr>
<tr>
<td>send, sendmsg,</td>
<td>TCPIPSendUDP</td>
<td>The data passed by these BSD functions will need to be altered to match the format used for the Marinetti call</td>
</tr>
<tr>
<td>sendto</td>
<td></td>
<td></td>
</tr>
<tr>
<td>setsockopt</td>
<td></td>
<td>There is no way to duplicate this function</td>
</tr>
<tr>
<td>shutdown</td>
<td></td>
<td>There is no way to duplicate this function</td>
</tr>
<tr>
<td>socket</td>
<td>TCPIPILogin</td>
<td>The Marinetti call also provides a number of configuration parameters, which the BSD function requires other calls to duplicate</td>
</tr>
<tr>
<td>write</td>
<td>TCPIPWriteTCP</td>
<td>These calls are functionally equivalent</td>

</tbody>
</table>
Connect methods

- **conEthernet** $0001 A generic ethernet card
- **conMacIP** $0002 IP gateway over AppleTalk/LocalTalk
- **conPPPCustom** $0003 Scriptable PPP
- **conSLIP** $0004 Scriptable SLIP
- **conTest** $0005 Developer test ID – not for public release
- **conPPP** $0006 Basic PPP
- **conDirectConnect** $0007 For connection of two IIGS’ via a serial cable
- **conAppleEthernet** $0008 Apple’s never released Apple II ethernet card
- **conReserved** $0009 Reserved for future use
- **conUthernet** $000A Uthernet ethernet card
- **conSweet16** $000B Sweet16 emulator
- **conReserved** $000C Reserved for future use
- **conEmulator** $000D A generic emulator

New link layer modules will need to be assigned a unique ID to use. The assignment of a unique ID is the responsibility of the Marinetti Open Source Project team.

Protocols

- **protocolAll** $0000
- **protocolICMP** $0001
- **protocolTCP** $0006
- **protocolUDP** $0011

Domain Name Resolver status codes

- **DNR_Pending** $0000 Request is still being processed
- **DNR_OK** $0001 Your request completed successfully, and dnrBuffer contains the requested data
- **DNR_Failed** $0002 The request failed. Either the connection timed out, or some other network error
- **DNR_NoDNSEntry** $0003 Requested domain has no DNS entry
- **DNR_Cancelled** $0004 Cancelled by user

User event trigger codes

- **trgUDPIn** $0001 UDP datagram received

System event trigger codes

- **strgNetworkDown** $0001 The network has gone down
TCP logic errors

The following error codes are issued by Marinetti’s TCP logic, and are standard TCP error codes from the RFC, they are not tool call error codes. A tool call error code indicates that the tool call failed, which in this instance is not the case. As such, these logic error codes will only be returned by TCP tool calls when the call succeeds, that is when the tool call error code is terrOK.
